No shit...

Sounds like you want a master antenna system.

If you have the cable already in place you will need to have it disconnected from the cable tv system first.

Next you attach the antenna to the clipped tv lead. Use all the right kind of connectors and stuff.

Now you have your own closed system.

Don't mix the cable tv and scanner coax...you could knock a satellite out of orbit.

And...
If you old tv coax is pretty old you might just want to scrap the idea and run new lines.

In the perfect system you would have a preamp and some nice splitters.

I have seen work fairly good when installed right.

He was inimitable, surely. I never met him but I have fond memories
of him in the old Fidonet SHORTWAVE echo. In fact, I got published in
his old newsletter "World Scanner Report" (March '92 if anyone's
keeping track.) One day, I posted my Carpet Loop plans on the echo,
and Bill was so taken by my plans that he asked my permission to
publish them if I would draw a schematic for him. I did, and he did.
I was delighted!

I know about his freebanding history--it was the subject of many a
flamewar on Fido. I don't care. Even though freebanders and hams are
supposed to be natural enemies, I could never hold that against him,
not when he worked so hard to develop mods for so many of our favorite
radios. Not when he got indicted for having a device (a data slicer)
that *I* own myself (otherwise known as a HamComm decoder!)

>Hey Bill! What freq's does St Peter
>use at the Pearly Gates ? - thanks Bill we miss ya!)

Rest assured that neither the FCC nor the CTIA will bother him again.

R.I.P., Bill

Take care,

Dave

You would get a great deal of interference with your cable TV signals. Cable channels use frequencies that are also used for on the air broadcast radio, secure in the knowledge that the cable is a closed system. (Is supposed to be, anyway). Put an antenna on it, and you're letting all that on the air signal interfere. AND radiating cable signal, which could interfere with broadcast stuff. (Not likely, but possible)

The short version:
You'll skrag your cable reception, possibly to the point of not being
able to get *ANY* channels, and probably destroy the throughput on your
network connections as well. Not to mention the very real possibility
that you'll hose your neighbors' reception too.

The long(er) version:
Cable is (ideally) a "closed" system. It uses many of the same
frequencies as "on the air" broadcasts, but being "encased" in the coax,
there's no problem. Effectively, it's a whole other planet in terms of
signals. Stick an antenna on it, and suddenly, you've injected a mess of
god-only-knows-what kind of hash into the pipeline. Not much different,
practically speaking, from sticking a needle in your arm and pouring in
anything you can lay your hands on. The result, in both cases, is almost
certainly not going to be good. The "hash" isn't neccessarily going to
stay in your house, either... It's quite possible (probable, actually)
that it will back-feed into the system and wreck reception for your
entire neighborhood. At which point, you may quickly find yourself
facing federal charges carrying heavy fines and a stiff prison sentence
for interfering with the legitimate users (the cable company and
customers) of the signal. This assumes that the neighbors don't hunt you
down themselves...

In summation, three short words: Don't do it.

Ok, was reading a little on listening t cell phones and also on how cell phones can be tracked. Now then, is it the phone itself that can be tracked, or the destination of the signal? i.e. Can my position be triangulated if I were receiving a cell phone conversation over my scanner? Doesn't make sense that it could be done, but then, what do I know? I'm dumb enough to be asking questions about scanning cell phones in a public forum.

Seriously though, I've got a Pro92 so I can't listen in anyway, I was just curious after absorbing some new information. It's a learning process...

Thanks

It would take special gear tuning up the IF (Intermediate Frequency) or
IFs being used in your radio, and could only be done from short
distances unless you had a really "leaky" rig, but yes, it can be done.
Britain uses the infamous "black vans" in a similar manner to locate
unlicensed TV sets. Or is it "Used to use"? I haven't paid attention to
British TV/Radio stuff in years - 'cept Tom Baker in "Dr. Who" when I
can find it :)

The phone doing the talking sends up a big ol' smoke signal and runs
around screaming "HERE I AM!" as long as it's being used, and when it's
not, the tower can send out a "Who's out there?" chirp that the phone
will respond to by sending it's ID information. That will immediately
put up another nice fat "puff of smoke" if it isn't powered off. This is
so the system can route a call to the phone should one be placed.

"Hey everybody! This is tower twelve. I've got a call for phone ABC-123.
Anybody seen it? Over. <Skttt>"
"Yeah, Tower Twelve? Tower 87 here. Toss me that channel. I can reach
Tower 42 in Podunk Idaho, and he just told me he's got ABC-123 in range.
Over. <Skttt>"
"This is SAC. Set missle targets to Podunk Idaho and fire at will. Over.
<Skttt>"

'scuse me while I duck... :)

Your neighbors on the same cable system could watch you, know what you're watching, listen to your cell phone, learn your credit card and Social Security numbers, order pizza through any baby monitors in the house, be able to hear if you're listening to cell phone calls on a modified scanner, know how you voted in the last 2 presidential elections, see you when you're sleeping and know when you're awake, use your house wiring as their shortwave antenna, change your TV channels at will, get free e-mail, get your $10,000,000 when the Publishers Clearing House people come a knockin', adjust your thermostat, see your last 7 years of IRS 1040 forms, start your car from the convenience of their home, buy stuff on each of the home shopping channels, find your mothers maiden name, book cruises, damage your good name and reputation in cross-dressing AOL chat rooms, get a look at you Permanent Record, etc. Doing this kind of splicing is just not a good idea... unless you like the idea of your neighbors watching and counting how many Viagras you take when wanting to feel a lil frisky.

For awhile, there was an outfit doing a 'black van' act here in the US. Before TVRO units became popular, there were firms around the country that distributed TV via microwave, seems it was about 1.9 GHz., and this spawned hordes of 'pirate receivers'. Antennas were distinctive and were generally hidden in attics. This outfit would run around with a van equipped with a directional antenna, a broadband amplifier and a spectrum analyser that they used to search out local oscillator leakage from the 1.9 GHz converter. Offenders were reported to the microwave distribution firm and consequently dealt with. I know that they had some success with this in California.

I paniced a little over this when shortly thereafter the ECPA was enacted. I imagined a huge fleet of vans running around looking for scanners and suchlike in peoples' homes . A scanner puts out a very distinct local oscillator pattern. Most scanners aren't designed to minimise l. o. leakage. They emit quite a signal and would be easy to find this way.

The COMET SMA 3 is fantastic for VHF high, UHF and especially in the 800-900 mhz range.

HRO or other ham / electronic stores might have it.

Bought my first scanner last night, a used Radio Shack pro-66.
Very happy with it and had a quick question for you all :)
Where's the best place to find a list of frequencies for the toronto and thornhill area? I went to chapter's (bookstore) and search in there computer for scanning books, the only one they had was one called Haurtag scanning book or something like that but all the copies were out. Is that the best book or should i just go to radio shack or someplace to see which they have?
Any help is appreciated.
thanks
Rob

Yeah, but they would have to be very close to receive the LO from the
scanner.

With the right sort of directional antenna and amplifier the LO can certainly be picked up from the street In some cases the content of the message on the channel that the scanner stops at can be demodulated.

What a load of well you know. They would have to be in the same room to track a receiver and with the amount of RF pollution out there it is almost imposable to track a receiver. In most countries listening to analogue cell phones is NOT ILLEGAL. Canada is one of those free countries. I have sat and had coffee with the police while listing to the cell frequencies on my modified Alinco DJ-580 and we have all gotten a good kick out of what was said. Most cell phones are going digital now and are almost imposable to scan with an analogue scanner now. One other thing to ask yourself is why would the government spend millions to take your cheep little scanner away? The trick is not to repeat anything you hear on the scanner and not to use it for profitable gains.

Actually, this reminds me of radar detector detectors. As you all
know, super heterodyne receivers will emit rf that can be detected.
Radar detectors are famous for chirping when another radar detector is
nearby.

So, this begs the question, can the detector rig be detected by
another rig?

Now for some fun thoughts. Car And Driver magazine had a spoof add or
article (it's been a while) about the CHARM (Compact Highway Anti
Radar Missle). It was basically a scalled down version of the ARM
missles that the airforce uses to knock out enemy radar
installations. The idea was, the cop clocks you, and you clock him
right back ;-). I suspect that mall security systems on the X band
would be targeted as well if you weren't careful...

So, the black van drives by, emitting just the rf that a detector rig
would send out. What do you do? I see two choices. You use your
expensive ARM modified to blow the van sky high and leave a nice pot
hole in the road, or you use a modified magnatron to direct a high
energy electromagnetic pulse to the van, frying all the electronics on
board. The second solution has the benefit of not leaving a pot hole
on your street and also can be fired as many times as you like.

In the US, you can't make such a claim until you've done a thorough
reading of both Title 47 CFR Part 15 and the Type Acceptance standards
that the FCC imposed upon the manufacturer of a particular brand and
model scanner. Without a fully-equipped lab, you have no idea if
the modification you've performed keeps your scanner within the limits
of the Type Acceptance boundries.

Just giving your scanner more channels might have an adverse effect
that you're not even aware of, yet could be causing havac with other
spectrum users.

Just traded in my 92 for a 92A at the RS in Normal, Illinois. Somewhat small city, so they are definately getting around.

Question now: On the original 92, when I had it in open mode on an LTR trunk mode, it would stop on transmissions even though I didn't have any talkgroup IDs stored, but the 92A will not stop on any transmissions now in open mode. I thought it was only supposed to use the talkgroup IDs when in closed mode. I know it's receiving cause if I turn off the trunk mode, it starts stopping on the transmissions.

Any ideas?

To find out if it is an image or not, find out what your scanner's IF is, multiply that x 2 and subtract the result from the frequency you're hearing the celluar traffic on. Next, look up the resulting frequency in an FCC database (i.e. PerCon) and check to see if that frequency is in use in your area. If it is, you've tuned in an image. If not, it's just a spurious signal.

Ham autopatch works in pretty much the same way. http://www.qrz.com and a book called "The ARRL Repeater Directory" will tell you which Ham VHF/UHF repeaters are autopatch equipped. Being a news hound, I monitor those quite a bit for juicy 911 calls.

I don't know anything about his military service but having been in the Army and the Navy is quite possible. I have known several people that have been in more than one military service and one of them had been in the Army, Air Force, Navy and Marines.

Gary -

You are making yourself look like an idiot. Glen wasn't laughing at death,
he was laughing at "...kind mannerisms...?" being used to describe Cheek.
That is something that any intelligent thinking person would have done.

Cross-posted to: rec.radio.shortwave,rec.radio.scanner

All,

The company DWM communications is located on the world wide Web, at this URL:

http://www.qth.com/dwm

They sell the following products:

Tiny Tenna
QRP CW Rig
Signal Trap
Antenna Tuner

Their phone number is 1-517-563-2613.

This "company" is actually a front for a terrorist organization. The products they sell are obviously not real radio products, they are all cheaply made and a ripoff.

Anytime you buy a Tiny-Tenna or any DWM products, you are supporting a terroristic organization. This organization, headed by the main terrorist Bill Lauderbach, will do ANYTHING to destroy YOU, YOUR REPUTATION, and YOUR LIFE at their own whim.

If you buy from DWM, you are literally taking your life into your hands! This poster has heard from an anonymous source that DWM has actually ordered "hits" on the lives of several people who have complained about them. I cannot give the source of this information, because the source themselves is at extreme risk. But the word is that if you order from DWM, once they have your information YOU TOO are at risk!

So take heed, and avoid these terrorists! You will be much safer and better off! Above all, *NEVER* provide them with your mailing address, phone number, or any personal data! They keep a "blacklist" in their company files (according to a disgruntled former employee), and if you land on that list, WATCH OUT.

Be warned, and order elsewhere.

Sent via Deja.com http://www.deja.com/

Toll Free <tollfree@bigradios.com> wrote:
>No, it isn't.
>Spreading information, with the intent to help others gain knowledge is one
>thing.

Without a fully equipped lab and the expertise to use it, you have
no idea if the modification you make to your radio will have an
adverse effect to other users of the spectrum. Your scanner is
covered under the CFR Part 15 regulations as an unintentional radiator,
and it DOES radiate RF. There was a case where someone's unattended
scanner was radiating enough RF to lock up a repeater some distance
away.

An innocently done "mod" to your scanner might cause havoc to any
of a number of radio services; in particular, if you reside near
an airport, use special care with what you do to your radio(s).

>Selling drugs is another.
>I would hope so, you hypocritical ass!

Source record: 83729

I have updated the download file for US. Scanner Online. This is to take care of some links that didn't work. I also needed to take care of some HTML coding that may have given some browses problems. For those of you that save USSO you should download the new version.

For the rest of you, there are some new features that you should check out. First there is a message board on the home page now. All you need to do is line down past the archived issues of USSO and you will find it.

While you are down there you will find several new links. There is one for Ebay that will connect you directly to their consumer electronics department. There are two sections that have scanner in them, ham radio and receivers. Check them out.

I have also added a link to CRB books and at the bottom of the page you will find links to other publications of interest to the scanner user.

Please stop by and check it out and enjoy.

1970. Electrical Meters (Yes, this is on-topic)

Newsgroup: rec.radio.scanner
Date: 2000-07-29 00:00:00 UTC
From: Ted
Message-ID: <2906018372506@rec.radio.scanner>
Source record: 83730

Southern California Edison went down our street today, replacing all of the electrical breaker panel meters with new models. When I asked the installer why this was being done, he indicated that the new models can be read each month by a passing company vehicle that listens for the new meters' "built-in RF transmitters."

Although telemetry is the last thing on my "hot frequencies" list, I'm nonetheless curious if there are any designated frequencies for these devices, what type of signals they emit, etc.

(Well, either it really was the electric company that came by, or just more NSA spooks in Edison costumes going about their usual task of building the surveillance superhighway. ;-)

From: birdy60 <birdy60@globaleyes.net>
Message-ID: <so777hn7o0b88@corp.supernews.com>
Source record: 83733

Hi all, I just got a secondhand scanner-a radio shack Pro-49. I'm very happy with it. It's a 10 channel programmable model which suits me fine for my small town area. I have a question though. While I was listening to it, the police dispatcher and cop in the car switched to "channel 11" and all that came through was garbled sounds, like the peanuts gang teacher :-) Is there a way to tap into those kinds of frequencies-are there frequencies that are not openly known but that are available through a little searching? If someone could point me in the direction of those "secret" frequencies or where/how to look for them, that would be helpful. And if you need to know, I'm in Southern Illinois-Murphysboro to be exact (close to carbondale). Also, an email would be helpful as I don't check NG's as often as I would like to.

Thanks,
Judy

1976. Re: Electrical Meters (Yes, this is on-topic)

Newsgroup: rec.radio.scanner
Date: 2000-07-29 00:00:00 UTC
From: Kent <kentp@scc.net>
Message-ID: <3983AFFC.A28A92ED@scc.net>
Source record: 83736

Both our electrical and gas utilities installed small part 15
transmitters in twin cities homes. The gas system uses a vehicle that
drives in the neighborhood and sends a "wake up" call to the
transceivers and they begin to dribble data out of the gas meter. Our
local power utility mounted transmitters on the power meters on houses
that transmit to small 1 ft x 1 ft boxes on utility poles every few
blocks. These boxes have two cellular style antennas hanging down from
the underside, and feed out via a 900 mhz yagi. Both our utilities use
a couple of their 800 mhz radio channels for this neighborhood data.
One of their radio techs gave me one of the channels, but I've misplaced
it other than to remember it was in the 800 mhz area. In Minneapolis,
the city water utility installed a small auto dialer modem on the water
meter. Once per month it calls in with water usage information via *my*
phone line.

Since this NG is rec.radio.scanner, I assume that your outdoor scanner antenna is a wideband omnidirectional
antenna.
Most tv antennas are directional, and have multiple elements that are resonant at tv broadcast frequencies.
Therefore the tv antenna has gain in the frequencies that it was designed for.
The scanner antenna probably would not make a good tv antenna.
But regardless of what anyone offers technically, the best way to answer your question is to simply try it.

1983. Digital Scanning USA

Newsgroup: rec.radio.scanner
Date: 2000-07-29 00:00:00 UTC
From: Steve Guthrie <steve.guthrie@sympatico.ca>
Message-ID: <398267DB.5322@sympatico.ca>
Source record: 83769

Hi there

The municipal police force up here in Peterborough, Ontario, Canada went to an 800 MH digital encripted system several years ago. I'm in the news media and the Chief told me it was to keep local felons from listening in to their broadcasts. We in the media could just like it or lump it.

(Thanks Chief!)

I was later told that this would have been impossible to do in the USA. Something to do with the US Constitution and the rights of a free press and that if any goverment organization went to an encripted system, all credited news gathering agencies were to be provided with a receiver capable of picking up the broadcasts.

'strue? Or am I 'way out in the long grass?

Steve

PS I use a BC SC200 and can pick up ambulance and fire plus the Provincial police, so the loss of the city cops is a pain, not a fatal illness.

The legal issues have not been tested in the courts yet. For a summary of legal precedent in support of the idea that Americans have a constitutionally protected right to monitor government radio traffic, visit the Rapid Media Project website at http://rapid-media.org .

I didn't want to use the scanner antenna as a TV antenna, but rather had the idea that if I tapped the scanner
antenna coax into my TV coax I might be able to have access to the scanner antenna from more than one place in
the house. I'm just starting out in radio and I'm not an electrical engineer, so I didn't know the feasability
of doing this. It didn't sound right, but figured it wouldn't hurt to ask.

And for Bob Dolson who simply dismisses me as an idiot with stupid ideas...

Thhhhhhtptptptptptp!!

Try being helpful instead of an asshole.

Well, being as I wouldn't want to scrap my cable TV, I'd have to run new line anyway.

Splitters was my next quest. Are they feasible to feed different outputs (not used at the same time, but in
different rooms)?

Don't over do it,but yes the more runs the more you will lose gain.
keep the runs as short as you can and use quality cable tv type of
splitters.
Depending on the frequencies you monitor you will encounter line loss.
If you are straining to hear stuff this will not be a good system. If
you live in a metro area it can work real nice.
If you try to run multiple receivers you could start injecting noise
into the whole thing.

I have one that was purchsed and modded for cell by Grove. It is in
pristine condition, bright back light with original box and the original
Grove shipping box, manual, a real non copy of the service manual,
antenna. $300 plus shipping.

Actually, I think what happens is that it says "Departure Scan" or
something like that next to the Cach, IL line, meaning that it has left
whereever it last was en route to Cach, IL. When it gets there, it
changes to Arrival Scan (and time it arrives).

What I want to know is why according to the UPS tracking, my scanner is
sitting in this Cach, IL place (but was actually delivered today).

I just bought a Pro-92A. I fired it ypu and pressed 3. firmware version
3.25. It was in
Secaucus New Jersey. More 92A's are on there way to stores. Paid 249.95.

All you did was come here, read the original post, and reply with malice.

Go to hell.

You NEVER did address the question about you knowing him that I raised, did you.

More than not, that means that you DON'T want to, or it would destroy whatever small shred of credibility that you have.

Have a bad day today, a worse one tomorrow, and hopefully, someone treats you the same way in YOUR death.

No, it isn't.

Spreading information, with the intent to help others gain knowledge is one thing.

Selling drugs is another.

You think that someone who is doing 56 miles an hour in a 55 zone is just as bad as the one who sells drugs to your daughter, too, eh?

I would hope so, you hypocritical ass!

Sure. But if it's really digital and encrypted, one must also obtain the
decryption key. That turns out to be a LOT tougher than simply copying
the receiver.

> 'Tis indeed sad when a young man of 50 years passes away. Not meaning any
> disrespect, but, who is Mr. Cheek?

Joe, this question is often asked, here is the standard response below.

Author: John Mackey, Jr (jmackey@usaXXX.net)
Amateur Radio Extra Class call sign KS0F

Bill Cheek was a man who lived near San Diego. He used to be active on
Fidonet but then had to leave due to reasons we won't speak of now. He
then became active on this NG & the internet but was again involved in
much trouble. Various problems with Mr. Cheek's action's
resulted in Peter Laws kicking him off of the "Scan-L" mailing list. More
similar problems with Mr. Cheek caused him to have his internet access
revoked by his Cable company ISP in summer 1998. In 1999 he was briefly
held by (federal) authorities and has been charged in (federal) courts with
various illegal actions in regards sales for the use of scanners. (He had
admitted to other legal problems in the past, also) He was the owner
& operator of a company called "Comtronics" & has produced a few books
based on information he had complied from various sources.

Despite various rumors, Mr. Cheek did NOT have any FCC issued licenses
within the last 15 years.

Mr. Cheek claimed to have been in the Army, others said he had been in Navy.
His rank or billet is unknown.

Mr. Cheek was well known by many for various reasons in the radio community.
Some people feel his technical knowledge was notable, some people feel
certain aspects of his personality were notable.

Due to mounting legal problems followed by health problems, in 1999 a
donation request was made to the general public to assist Mr. Cheek who
had no health insurance. His legal issues were being addressed by a public
defender.

Mr. Cheek was a smoker and died in July 2000 due to complications of Lung
and Brain Cancer.

He is survived by his wife Cindy and his children.

Mr. Cheek will be missed.

2015. S-Meter output on PCR1000

Newsgroup: rec.radio.scanner
Date: 2000-07-30 00:00:00 UTC

Has anyone explored exporting either an analog S-meter output,
or the digital word that represents the S-meter reading of the PCR1000
receiver for use with other computer applications ??

I am interesting in integrating a PCR1000 as
part of a GPS-based drive-test package for capturing
signal-strength readings along with lat/lon position

If anyone else has been researching this, I would like
to hear from you ..

Thanx

Trish

The way I look at it, in this modern age with all the choices, people who are concerned about their
communication being understood over airwaves, should take their own responsibility and encrypt their
information instead of relying on us (the scanner people) to have our devices crippled.

>if I program the trunked frequencies in, I never get anything.

Well it depends on the height of your antenna. Basically it is line of sight,
also when using outdoor antennas you must use low loss cable and shortest
length because the cable itself will absorb much of the signal at this
frequency.
You could hear the trunked systems conventional frequencies, but the
problem of not being able to decode the data channel can be caused by the
length of the path and sensitivity of your receiver.

2029. FT Trade laptop for scanner or ?

Newsgroup: rec.radio.scanner
Date: 2000-07-30 00:00:00 UTC
From: riccamp@freeway.net
Message-ID: <39848b27$0$50269$2486905f@news.freeway.net>
Source record: 83615

For Trade :

I have a COMPAQ laptop computer, model LTE ELITE 4/40CX I would like to trade for a good working desktop scanner. Must cover 800-950 mhz band, preferably cellular enabled.(or have ability to do so).

Computer is in good working condition, needs a new battery and trackball needs a cleaning. Works fine with AC cord power. Specs: 486 40 mhz, 340 meg hard drive, 16 meg ram, black carry case, DOS 6.22 and Windows 3.1 installed. Also has Microsoft office(Word, Excell,Powerpoint) and Quattro Pro installed. Display is color.

Please contact me by email: riccamp@freeway.net

Might consider trade for something else - VHF commercial HT or maybe a surveying level or transit

Make me an offer, Eric

The actual frequency is 163.4125 MHz and the FCC has no jurisdiction
over it. In the U.S. it's a federal government frequency administered by
the NTIA. If you're near a navigable waterway, look for an Army Corps of
Engineers hydrologic or flood control station.

The distance at which you can hear a signal depends on the strength of the transmitter (fast food restaurants are really low powered), the height of the transmitting antenna, the height of the receiving antenna, obstructions between the two antennas, the sensitivity of the receiver and a whole lot more.
Radio systems that are meant to cover a relatively small area - such as Disneyland - are generally low powered with a limited antenna system. It can be difficult if not impossible to monitor such systems from more than a few miles away.
Radio systems meant to cover a wide area, such as a county sheriff's dispatch center, are much more powerful, have elaborate antenna systems (often with remote transmitters and receivers) and can usually be monitored from many miles away.

Stay out of it, John! Don't be playing the unctuous, concerned and caring hobbyist now. You had plenty of time to display some sense of decency and regard for the family's feelings for some months now. You used the time to suggest that Bill's condition was a fraud, to heap scorn upon him and make light of his impending demise and to ridicule his family. Right now you'd do well to just shut the **** up!

Get lost you ghoulish little cretin! Haven't you had enough of your sick "fun" by publicly ridiculing the Cheek family's recent bereavement? You are a worthless and detestable bit of human corruption that has established itself as a blight on the news group in the minds of all but a few of your syphilitic sycophants. You are damn lucky you ran away the day you drove up to Seattle -Tacoma and spent the day jamming and abusing folks on the 5.23 (Lake Tapps) repeater. I guess that since you couldn't "fry" it that was the next best thing you could think to do with you ham equipment. Just get out!

Oh, please. No one is likely to get thrown in jail for misconnecting
their cable TV wires, especially in a case where "theft of service" is not
involved.

I'd bet heavily that the next-to-worst that would happen is that he'd get
a visit from the cable company (after a routine check of the displays from
the remote TDR equipment installed throughout the "outside plant" showed
this hookup like a beacon), who would ask him to put things back the way
they should be.

If he didn't comply, then the WORST that would happen would happen,
namely, the cable company would disconnect him.

Now if the *cable company* permitted an RF leak of this magnitude (or even
smaller) despite FCC protests, the cable company would be up for some
fines (and that is why, performance of their system aside, they check up
on this stuff regularly).

I use Kermit, v3.16 for MS-DOS and K95 for Win, to drive my RS Pro-2052 scanner, with excellent results. The scripts are (almost) interchangeable, and the software is way cheaper than the Pozilla offerings (The MS-DOS version is FREE!) and, I'll bet, lots faster. Kermit is available for every computer platform out there, and extraordinarily portable; scripts that run on Linux, for instance, will run on other platforms with only teensy mods. Is anybody else doing this? I'd welcome the opportunity to collaborate with others to develop a library of scripts for distribution to other monitors. Really, it's time to give those "pros" who write junky software the boot.

"John Bombard" <flyboy4097@home.com> wrote
> I know this probably sounds stupid as well as disrespectful, but WHO THE
> HECK IS THIS GUY?

This question is often asked, here is the standard response below.

Bill Cheek was a man who lived near San Diego. He used to be active on
Fidonet but then had
to leave due to reasons we won't speak of now. He then became active on
this NG & the
internet but was again involved in much trouble. Various problems with Mr.
Cheek's action's
resulted in Peter Laws kicking him off of the "Scan-L" mailing list. More
similar problems with
Mr. Cheek caused him to have his internet access revoked by his Cable
company
ISP in summer 1998. In 1999 he was briefly held by (federal) authorities
and has
been charged in (federal) courts with various illegal actions in regards
sales for the use
of scanners. (He had admitted to other legal problems in the past, also) He
was the owner
& operator of a company called "Comtronics" & has produced a few books based
on
information he had complied from various sources.

Despite various rumors, Mr. Cheek did NOT have any FCC issues licenses
within
the last 15 years.

Mr. Cheek claimed to have been in the Army, others said he had been in Navy.
His
rank or billet is unknown.

Mr. Cheek was well known by many for various reasons in the radio community.
Some
people feel his technical knowledge was notable, some people feel certain
aspects of his
personality were notable.

Due to mounting legal problems followed by health problems, in 1999 a
donation request was
made to the general public to assist Mr. Cheek who had no health insurance.
His legal issues

were being addressed by a public defender.

Mr. Cheek was a smoker and died in July 2000 due to complications of Lung and Brain Cancer.

He is survived by his wife Cindy and his children.

Mr. Cheek will be missed.

They switched to voice inversion (The radios invert the wave of the frequency). I understand that there are either products or build it yourself kits that will re-invert the signal but I don't know how lawful that is. Speach inversion is kind of a poor mans way of encrypting. I'm certainly not an expert on this since radio scanning is just a hobby of mine so if someone else has a more accurate explaination please share :)

Sounds like they had good reason to "delete" your site. If you have copyrighted material on your website then that puts them at risk. Next time try keeping a backup copy of your website on your own computer so you can upload it to the next web hosting company that you choose to put in jeopardy.

Due you have a need for an SMA-TO-BNC antenna adapter that is custom
made to fit and protect your H.T. or scanner radio?

Adapter allows you to:
Quickly change your antennas to base,mobile or different style use.
Use the more popular and wider selection available of BNC antennas.
Prevent chassis connector wear or from coming loose due to always
having to change antennas.

Adapter features:
Gold contacts with teflon insulation.
A low profile design with a rubber covering for a factory antenna look.
The base seals to the top of the radio with no spacers needed for
moisture and dirt protection.
The base also provides an excellent support for all your antenna
applications.
No need to remove to make any antenna changes.

Sizes-to-fit-radio-models:
Yaesu: VX-5,VX-1,VX-10,FT-50-R
Icom: IC-R2,IC-T8A,IC-T81A,IC-Q7A
Kenwood: TH-D7,TH-G71
Alinco: DJ-V5
Standard: C508A,C510A
Radio Shack: HTX-200,HTX-400,HTX-245
Aor: AR-16

Previewed in the May 2000 issue of CQ Magazine.

$11.95 + $1.50 S+H (One to unlimited)
(Check or money order only)
(Specify-radio-model)

Two undesirable conditions would occur.

1.) Ingress - This is where signals that are transmitted over the air would be present with signals on the same frequency that are transmitted from the cable system headend. The result would be equivalent to two guys talking on the same CB channel at the same time. In other words your picture would look and sound like shit. Oh and your cable internet connection probably wouldn't work either.

2.) Egress - The signals being sent to you by the cable company would become "airborne". In other words your TV antenna would become a big path for those cable signals to radiate into the air. This has nothing to do with cable company security but a lot to do with keeping broadcast radio/TV frequencies clear for the intended user. This is a mandatory routine for the cable company as set forth by the FCC. If you generate a leak that big your cable company WILL find it and if they can't get inside to fix it they WILL disconnect your service until they can fix it.

This question is often asked, here is the standard response below.

Bill Cheek was a man who lived near San Diego. He used to be active on
Fidonet but then had to leave due to reasons we won't speak of now. He
then became active on this NG & the internet but was again involved in
much trouble. Various problems with Mr. Cheek's action's
resulted in Peter Laws kicking him off of the "Scan-L" mailing list. More
similar problems with Mr. Cheek caused him to have his internet access
revoked by his Cable company ISP in summer 1998. In 1999 he was briefly
held by (federal) authorities and has been charged in (federal) courts with
various illegal actions in regards sales for the use of scanners. (He had
admitted to other legal problems in the past, also) He was the owner
& operator of a company called "Comtronics" & has produced a few books
based on information he had complied from various sources.

Despite various rumors, Mr. Cheek did NOT have any FCC issued licenses
within the last 15 years.

Mr. Cheek claimed to have been in the Army, others said he had been in Navy.
His rank or billet is unknown.

Mr. Cheek was well known by many for various reasons in the radio community.
Some people feel his technical knowledge was notable, some people feel
certain
aspects of his personality were notable.

Due to mounting legal problems followed by health problems, in 1999 a
donation request was made to the general public to assist Mr. Cheek who
had no health insurance. His legal issues were being addressed by a public
defender.

Mr. Cheek was a smoker and died in July 2000 due to complications of Lung
and Brain Cancer.

He is survived by his wife Cindy and his children.

Mr. Cheek will be missed.

2102. Danger - DWM Communications will rip you off!

Newsgroup: rec.radio.scanner
Date: 2000-07-30 00:00:00 UTC
From: Newswatch2 <newswatch2@my-deja.com>
Message-ID: <8lvsdk$44h$1@nnrp1.deja.com>
Source record: 83740

To All Readers:

DWM Communications website can be found here:

http://www.qth.com/dwm/

AVOID Tiny-Tenna and buying ANYTHING from DWM communications. Not that the products themselves are bad (although many say they are!), but DWM communications is actually a terroristic organization similar to the Scientologists. If you say something they do not like publicly, they will pursue you with their lawyers, tell lies to your employer, and do everything they can to smash your reputation. Ask the folks in rec.radio.shortwave!

Take a look at the spamming going on in rec.radio.shortwave. All of it is originating from DWM communication staff. They are currently attempting to disrupt and destroy many radio-related newsgroups through repeated, malicious spamming.

The president of the company, Bill Lauterbach, entered r.r.s. for the purpose of threatening, terrorizing and spamming the group.

If you give your personal information to DWM Communications, Inc. they will most likely abuse it, and may even give it to others! This company (that makes the "Tiny-Tenna") is UNSAFE TO BUY FROM, and if you buy from them you are risking not only your money, but your sanity and peace of mind as well!

You should note that this company also advertises freely on radio stations that promote fascist and racist material and carry such programming. This makes the company a racist organization, and if you buy from them you are supporting racism!

The "Tiny-Tenna" product is simply $5.00 worth of parts that anyone could build themselves, even a child. Yet they charge $19.95 for it, making a probably 400% markup.

Take this as a warning, and NEVER buy anything from DWM.

DWM's website can be found here:

http://www.qth.com/dwm/

Their phone number is 1-517-563-2613

Their address is: P.O. Box 87-W, Hanover, MI 49241

DO NOT ORDER FROM THIS COMPANY!! You will be risking a lot, and it is not worth it! Keep your sanity, your peace of mind and your money, and

order from another company instead!

If you are wise, please contact the company and let them know how you feel about the spamming going on! And above all, avoid ordering from this company at all costs! It will be the biggest mistake you have ever made in your life!!!

Sent via Deja.com http://www.deja.com/

I guess it would depend on what type of
faxes you were trying to decode...
there are WX faxes on 136-138mhz
there are WX faxes for "high Seas" all over the short wave bands - discone
antenna
won't work there..
Lastly there are fax signals on microwave
band which your discone antenna couls be used for.

LOL

Ain't that the truth?!

Back in the middle sixties, the Mississippi State Sovereignty Commission (the state equivalent to the KuKluxKlans) used to tap the phones at a radical, revolutionary organization (the Wesley Foundation - United Methodist Church) where I occasionally stayed and we had more fun with the tappers than they did.

Of course, the Sovereignty Commission thought that they could learn all sorts of things about our radical (and probably communistic) methods but [sigh], the poor fellows forgot one very important thing: we were teenaged males and our phone calls had more to do with our girlfriends (or "potential" girlfriends) than it had to do with any sort of "subversive" activities.

Plus - because racists and other types of prejudiced "people" - are, basically, stupid (as "prejudice" always shows itself to be stupidity), the retards (as are all racists and any and all "people" who judge others by any other means other than as an individual and that individual's ethics and morality) were stupid. They didn'y know what a "ground" was and, so, everytime they activated their tap, they introduced a 60-cycle (as we said back then) hum.

We used ta dial the first number and then say, "I realize that racist oinkers are all virgins but if you pay attention, you'll be able to, at least, get a girl to go out with you". (or words to that effect)

[That was, of course, long before I realized that racists/sexists/prejudiced bigots all suffered from /really/ serious sexual problems and that we couldn't help them - that these people would all end up - sooner or later - in prison (which they might enjoy) or a mental hospital.]

I've always wanted to be blackmailed. I just want to get a decent price on the color, glossy, 8"x10"'s.

I think they would make GREAT holiday cards.

This question is for someone that knows a lot about electronic components in scanners. I own a Pro-2006 (Love it!) and was wondering how long I could expect it to last.

I use it to death: it never gets really warm, and I take care of it well.

Is there any specific known problems with this model? I know that using external power is best, and dimming the display saves wear and tear, but how about the other parts? How long do capacitors last? chips, etc..? Is there a good environment that electronics should be stored in when not being used for a period of time?

Thanks for whoever responds to the post... and you can e-mail me directly if you want to chat. I am looking into buying another pro-2006 as a backup, as I know that they are becoming rare!

Mark.

2123. Trade Like New Icom R2 for ATS-909 or Sony 7600G

Trade my two month old Icom R2 with manual, stock antenna, charger, 4 RS NiMH
batteries bought recently, all in new cond. for Sangean ATS-909, DX-398, or Sony
7600G in excellent cond. No scratches or marks please. Tnx.

Electrolytic caps can dry out and die, but that usually takes at least
10-20 years or more. I've used 40 year old radio gear that had
electrolytics in it that were still good, but I've also seen 10 year old
radios with dead caps. It's highly variable. ROM is sometimes subject to
"bit-rot", but again, that's a long-term (at least ten years, possibly
more, depending on the individual chip) thing.

As for everything else, the general rule of thumb for solid-state stuff
is "if it survives past the first 72 hours of being powered on, it will
almost certainly outlive you". Assuming you don't have power spikes
hitting it, pour a soda into it, or something like that, that is...

For long-term storage, pick someplace with a fairly stable, relatively
cool temperature. Low humidity (or throwing a few packets of silica gel
into the unit) will help prevent any corrosion that might try to
develop. You'll probably want to protect it from dust, as well. Other
than that, not much special handling is needed.

I doubt people were trying to cause trouble.
After reading your posts in here, I can see that they are
simply retaliating against you spewing nonsense like an idiot.
Also, your posts have a latency of 1 month on my newsgroup server.
Some people don't ever check dates. They are probably getting angry
for all the stupid things you said weeks ago, less recently.

My local water department(s) use the 173's for tank,valve and flow
telemetry. They don't transmit a whole lot of data at once, so I guess
300 baud work work just fine.

This should be an easy question here, I think. Someone (who else - my boss) ask me to find cost-effective h250 type of handsets.

So far from the net, I could find racal h250, but I don't think it is cost-effective to him.

Are there cost-effective type? or I have to redefine the threshold for the "cost-effective".

Thanks.

Mike

I can verify what Dan says about Corky jamming the 523 repeater. So can AB7DN, N0NZT and a number of other hams. He was cursing my name because I had exposed to the NG that he was a Nurses Aide for mental patients. Dan and a number of other hams alerted me when this happened. Yep, Corky the super Ham screaming profanity over the 523 repeater. So, Dan ISN'T the liar, John Corky Mackey is the liar, again. Calling John Corky Mackey a liar IS a bit redundant, isn't it?

I do have a diagram and if you post a real snail mail adress I could send it to. Working from memory, the IF strip is a fairly common IC so I suspect the S meter ought to be easy to find.
Do a net searh on PCR1000 and you should find a file with all the real/hidden commands. I have accessed the S meter via a MS-DOS com program, but it is very slow and flakey after the delay for the D>A.
Depending n your goal I suspect the PCR1000 is not what you want. The S meter is pretty useless even when compared with the one on my old Panasomic RF2200.
While I love BOTH my PCR1000s, they are not serious instramentation devices.
If you are going to use it in a moving situation [given GPS I suspect that to be the case] the delay in processing, even on a fast [p233/mmx] will make the meter way to slow.
Hope this helps.
What frequencies are you trying to measure?

2147. reorientation of VHF antennas to improve reception

Newsgroup: rec.radio.scanner
Date: 2000-07-31 00:00:00 UTC
From: kd7ijn@aol.comic
Message-ID: <20000731152211.27788.00001330@ng-cn1.aol.com>
Source record: 83535

This is something I've noticed while operating 2 meters that also improved reception for scanning the VHF-hi band. I use a ham rig and a BC 895XLT in conjunction with a Diamond vertical NR770HN mobile antenna (a half wave mag mount). When used inside, the antenna is attached to a (steel) pizza tin, as it requires a ground plane. Ham 2 meter FM and public service on VHF hi are invariably vertically polarized, so the natural assumption is that a vertically polarized antenna would always be best....

Indoors, this is not so. I have discovered that the orientation of the antenna... and this means anything from vertical to past horizontal and pointing downward, as well as the direction it points in, made a major difference in my reception and how others heard my signals, this was, presumably, due to the presence of wire mesh and steel construction of my residence and in nearby buildings.

The BC 895 responded in a similar manner to reorientation of the antenna. I found the signal strength of VHF hi signals increased, often dramatically (audibly rather than just S-meter increase), when the antenna was rotated in different directions and moved off the vertical.

Has anyone else encountered this situation? I'm wondering if reception improvements might be had by this simple trick.

Has anyone ever been prosecuted for doing such? In a highly visible case, my congressman, John Boehner, was monitored on his cell phone and a tape of it was even given to a newspaper. No one was ever prosecuted even after Congressman Boehner's repeated requests.

IMHO, the law HAS been changed by the Justice Dept's failure to enforce it.

Darrin has a valid point. Why spend $100 on a scanner that doesn't receive 800 mhz. when for another $30 more you can get one on sale that does receive 800 mhz.

No doubt there could be some scattering of the polarization indoors. Also, simply moving the antenna a quarter wavelength in any direction can result in improvement or nulling. I am curious as to the antenna requiring a GP- half waves are self resonant and do not require a GP.

I've been considering selling some of my radio equipment to buy a high end all-band receiver.

What do you folks think these items are worth ? I started watching ebay to get some idea of a few of the items that
I can find.

1) Radio shack Pro43 - Modified for full coverage - very good condition
2) Radio shack Pro 2006 / OS456 Combo. Full board not the lite version. RCA jack out the top from tapped Discriminator.
(would also include a home made 2 level FSK demodulator) - mint condition

3) Ten-Tec RX-320 - mint condition
4) Radio shack DX 440 good condition
5) Radio shack DX 398 - mint condition
6) Radio shack Pro 94 (1000 channel Dual trunking) mint condition
7) Yaseu FT-51R (Dual band Transciever) got my ham ticket but haven'd used it in a while...
(modified to also transmit outside of the
ham bands) very good condition

8) Optoelectronics OptoScan (Latest version, Latest firmware) mint condition

Plus

9) Optoelectronics M1 handi counter
10) Tektronics 456M 100Mhz Oscope.

A couple questions I have is how much better would the likes of the ICOM 8500 or AOR 5000 +3
perform on the VHF/UHF bands than my Pro2006/OS456 combo ? I love this scanner.

Would it be better to keep the Pro2006 or the OptoCom and just add a high end SW receiver ?

Other than the ICOM 8500 or AOR 5000 +3 are there any other units i should consider. These 2 seem to have
a decent following. Anything new coming around the corner that i should keep an eye out for ?

Any input from you folks is much appreciated. Thanks,
Dean

If your going to keep anything, keep the 2006 and the RX320, they are a
value at any price and are both excellent products. Mark my words, you will
be sorry if you sell them! As for the 51R, once you decide on a price, let
me know, I may be interested.

2158. Best indoor antenna setup I've found

Newsgroup: rec.radio.scanner
Date: 2000-07-31 00:00:00 UTC
From: Walker <worldvistaNOwoSPAM@altavista.com.invalid>
Message-ID: <006d2964.5ab8f438@usw-ex0101-007.remarq.com>
Source record: 83546

Hi everyone,

Here's the best indoor antenna setup I've found for handhelds or mobile units being used as a base:

(1) Buy the radio shack telescoping scanner antenna (Cat# 20-006)
(2) Buy the GRE Super Amplifier (available from Grove Enterprises, www.grove-ent.com)
(3) Hook the GRE to the scanner (put a 9v battery in it or use an AC adapter)
(4) Hook the RS telescoping antenna to the GRE amplifier
(5) Ground the base of the RS telescoping antenna (the knurled point where it connects to the amplifier) to something - a baseboard heater, some bed springs, or just about anything. You can do this with an alligator clip or a length of wire.
(6) Extend the RS telescoping antenna to its full length and use full gain (20 Db) with the GRE amplifier.

This is the best indoor setup I have found and performance is pretty good (better by far than the RS magnetic mount mobile scanner antenna which I have also tried). Of course this is no substitute for an outdoor discone or other antenna but it should yield the best indoor performance possible -- unless you have the space to mount an outdoor antenna indoors somewhere.

2172. Cordless Phone Questions

Newsgroup: rec.radio.scanner
Date: 2000-08-01 00:00:00 UTC
From: Anonymous
Message-ID: <05gr8028t48g042@rec.radio.scanner>
Source record: 83447

Since I've found no FAQs, I'll just ask here:

How does spread spectrum work? (I'm not new to radio, just SS. So a technical explanation is preferred. <g>)

What's the difference between frequency hopping spread spectrum and direct sequence spread spectrum?

Do digital phones use standard FM transmissions with "digital audio" or is another emission type used altogether?

I've never seen advertised a digital phone whose bitstream was encrypted. I take it no such phone exists (for the public)?

Hope this isn't too many questions at once. Many thanks.

Yes.. post the ones where Corky gets shredded by
Cheek. Which is probably all of them.

Life goes on. Except for Corky mackey who has no life
outside of this NG.

Mr Wey,

In an attempt to make you understand how these newsgroups work, please allow me to give you a civilized reply. This newsgroup is available to everyone around the world. Most messages are also "cross-posted" on several other newsgroups, including the ".uk" variant that I suspect you are reading this in. I read your message in the "rec.radio.scanner" newsgroup which knows no political boundary. Therefore you will see content not specific to the UK. Since the US has a significant population, many of which are interested in scanning, it stands to reason that a proportional amount of information will be from there.

My advice? Either look to more regional sources of information such as websites or mailing lists, or learn to sift through the newsgroups to find what you are looking for. Above all, avoid insulting an entire nation like you did previously, you may get more attention that you originally intended.

2189. Who is John Mackey?

Newsgroup: rec.radio.scanner
Date: 2000-08-01 00:00:00 UTC
From: John Mackey Sr <anonymous@cotse.com>
Message-ID: <200008010736.DAA16092@anon.cotse.com>
Source record: 83556

John Mackey, barely a boy was born on a reservation in Iowa. He attended East High School where he was the constant target of abuse by all his classmates and shunned by his teachers and the school administration. As a child he was know to the authorities for a broad range of deviant behaviors. He was classified as a sexual offender and had to move to Oregon in later years. John is a nurses aide and works for an agency dealing in mental patients. John spends most of his time driving to sights in Oregon and Washington to empty bedpans. He used to be active on Fidonet but then had to leave when the scanner echo moderator and John's BBS operator removed his access for acting as he does on this NG. John holds the record for off topic posts to this NG, 389 in one month. Most of these posts were made in the process of stalking Bill Cheek. John has been booted by many ISPs and BBSes. Even now he tries to lure the newbie into thinking parg.org is the place to send complaints when @Home is his ISP and the place to report abuse. In 1999 he was briefly held by (federal) authorities regarding the sale of Amateur Radio licenses. (He has admitted to other legal problems in the past, also) He is the owner & operator of no company, has never produced a book or any information of any use. He is known for destroying a repeater and power supply after he reversed the polarity during installation. John probably bought his ham license, even thought the answers to the test are published on the net and in many books. John has never served his country in the military due to his criminal history. John Mackey is not known by any

the radio community being he has never contributed
anything. Most people
feel his technical knowledge is zip, most people feel all
aspects of his
personality are sick and demented.

Sorry.
The one sad thing that I have learned to do is to hide.
Given that 5 years ago I made the mistake of posting, on another use group,
under my real name, the resulting barage of spam clogged the mail server and
a)nearly got me fired, then they calmed down and just wanted to kill my
net access. I am sure that you are who you say you are, and that you above
board, honest etc. But I no longe make any exceptions for anyone.
The images are electronic so maybe I can fidn a dead mail account to post
them from.
Sorry for the paranoia, but, while my job, like all jobs, is less then fun on
some days, it is still a job.

2192. FAQ: New Scanner Users

To All New Scanner Users,
If you are new to the radio monitoring hobby, I have compiled
a FAQ containing a collection of topics which are frequently
asked on the scanner newsgroups.

Topics include :
Look Before You Post
What's The Best Scanner?
Picking A Scanner/Receiver
Scanner Glossary
Scanner Model FAQ
Scanner Dealers FAQ
Frequently Asked Frequencies
FCC Frequency Databases
CTCSS & DCS
What's Illegal
Cellular-capable Scanners
Trunked Radio Systems
Co-ax Cable
Receiver Range
Your Scanner On A Plane
Frequency Counters
Magazines & Newsletters
Rechargeable Battery Tips
Radio Discussion Lists
Radio Modifications
RadioShack On-line Manuals
Uniden On-line Manuals
AOR On-line Manuals
Electra/Bearcat/Regency Manuals
Amateur & HF Radio Manuals
Handheld Scanner Antenna Review
Used Scanner Price Guide
Radio Monitoring Software
Receivers Covering Military Aero
Computer Control
Multiple Scanners And One Antenna
Do I Need An Amplifier?
Where Can I Get A Digital Scanner?
*What Is Reaction Tune?
*What's A Discriminator?
*What's A Good Scanner For Races?

In article <8m5d0o$q6$1@slb3.atl.mindspring.net>, wa6ube@tactical-link.com says...
>
>Send me an email address that is better
><thanNone@dontevntry.oro> , and I'll
>pass along my snail mail address ..
Is the addy for your ham ticket valid?
Printing only the town, "MOUNT HAMILTON".
If this is the valid address just say so, this is why I
no longer use any data that can be "Tracked" to me.
Yea, a reverse look up will reveal the site, but does anyone really
think it is the correct IP?
IF you are still the "Acting Chief Communications Technician w/ City of San Jose Info Technology Dept, Communications Division", surely they have a valid general address. Since your profile lists an interest on espionage, treat me as a spook!
Hint: Do a net search for QR?, then run *UBE.
I am frightened about the data out there.
Your degree of shock might vary!

2194. Re: S-Meter output on PCR1000

2197. Got any "Classic Cheek" archives to share with the group?

Newsgroup: rec.radio.scanner
Date: 2000-08-01 00:00:00 UTC
From: toomanyradios@aol.com
Message-ID: <20000801094528.04397.00000194@nso-md.aol.com>
Source record: 83564

Just had a great idea...you know how "Classic Peanuts" comics are being rerun, following the death of Charles Schultz?

How about "Classic Cheek?" You know...all the great Cheek one-liners from the early days of this newsgroup. Or, even back to the dark days of Cheek vs Mackey on FIDOnet.

Certainly someone among us has archived and stored all those great "Cheek-isms" of yesteryear...Cheek calling Mackey a "horse's arse" and Mackey returning fire with descriptions of his adversary such as "Butt Cheek."

Got 'em? Share 'em! Post 'em here!

The 210 0nly covers throught 512 MHz. There are various renditions of
the radio with varying amounts of channels but none cover above 512.

Greg

Is Mackey of Indian heritage?
Is he alcoholic?
Your information was very interesting. And its great to
finally hear it from a family member.
I'm so sorry Mackey, Sr. that your son is so screwed up.
Don't blame yourself. Some kids just turn out messed up.
Have you ever considered boot camp for this kid?
His behavior on this NG is indicative of sexual abuse
while young... are you sure nobody slipped him the
baloney pony (anal intercourse) while he was in grade
school?

The short answer is NO!

The first to go will be the LCD display. It will darken more and more with age until it is unreadable.

The hardest and most dangerous to repair will be the backlighting which uses 110 volts.

The various caps will eventually fail.

2214. New Austin TX Frequencies for 800 Mhz Trunked Radio System

Newsgroup: rec.radio.scanner
Date: 2000-08-01 00:00:00 UTC
From: Robert Barker <rbarker@austin.rr.com>
Message-ID: <DWHh5.485$C51.28806@typhoon.austin.rr.com>
Source record: 83581

I was digging around in the FCC website and found this list of Frequencies licensed to APD for 800 Mhz.

http://gullfoss.fcc.gov:8080/cgi-bin/ws.exe/beta/genmen/slm_freq_res.hts?db_id=16&file=A057593&key=1

The frequencies (105 of them) range from 866.0125 to 868.975 and include the 5 common ones found on all 800 Mhz Government Systems.

APD also renewed their licenses for Intercity: 155.370, and 154.950.
Thanks to Mike Simpson, with the city for getting this stuff updated.

http://gullfoss.fcc.gov:8080/cgi-bin/ws.exe/beta/genmen/slm_site_res.hts?db_id=16&link=0&callsign=A058083

Does anyone know the frequencies for Winter Haven (FL)'s new trunking system?

2218. Pro-2067 first impressions

Newsgroup: rec.radio.scanner
Date: 2000-08-01 00:00:00 UTC
From: Jon Van Allen <kf7yn@pop.slkc.uswest.net>
Message-ID: <398737ED.F86E5AE4@pop.slkc.uswest.net>
Source record: 83585

I just spent a few hours down at the one Radio Shack in
this area whose sales-droids know scanners. Here are a
few first impressions of the new Pro-2067.

The good news: Yep, it does follow the data channel and
shows the proper talkgroup ID.

The bad news: It seems to randomly miss IDs now & then,
whether or not they're in the ID list, regardless of closed
or
open mode. I double checked the programming instructions
to make sure I was in the data channel trunk mode. The
"T" is supposed to show up while scanning if you have
programmed the proper info. I can't get the T to show
except in the programming mode.

When I programmed it using the GRE software (my own)
it doesn't seem to miss any IDs, but it sometimes says
"all channels locked out!" and continues to scan, even tho
the channels aren't locked out! Anyone else notice these
problems?

Jon

2220. IC-PRC1000 information request

Newsgroup: rec.radio.scanner
Date: 2000-08-01 00:00:00 UTC
From: n2ogm@aol.com
Message-ID: <398756d6.3328757@netnews.worldnet.att.net>
Source record: 83587

Looking for those using the Icom IC-PRC1000 radio. Thinking of buying one but would like to know how they work by those using them before spending the money. Also wondering what the scanner rate, number of channels scanned at a time, etc. Seems reasonable for the price with pretty good specs and it's a nice compact package. Thanks to all that reply.

Jon:

The term "locked out" has a different meaning with the PRO-92, and PRO-2067. When you're scanning in the locked out mode, it only scans trunked frequencies that you've entered I.D.'s for, and the I.D.'s that you did not program, within that group are skipped. Also, the same applies for non-trunked frequencies, using CTCSS...it will scan the ones with the CTCSS tone programmed, and skip those that do not have CTCSS tones programmed.

I'm beginning to wonder if the PRO-92, and PRO-2067, may be misunderstood to some extent. The whole operation, and programming, is quite different than we're all accustomed to.

Chris:

Go to http://www.icomamerica.com

They have all the specs, pictures, and even screen shots of the supplied software. The supplied software is somewhat dated, and was written for DOS/Win3.x, but with some tweaking of your system, you should be able to get it working ok under Win9x/NT4/2K.

It is a excellent VHF/UHF communications receiver, and a pretty decent HF receiver, including USB/LSB modes. You may want to explore many of the third party software options available on the web! It is constructed very well.

All,

The link below will take you to my web site which has an MS Excel spread sheet containing these frequencies. You can view it and print it or save it to disk and print it. I will try to verify the frequencies on Thursday and Friday and update the file on Friday night.

http://www.netusa1.net/~bdburton/

Later,
Bryan

Look under the Electronic Communication Privacy Act. No current scanners that
can be sold in the US are allowed to be modified to listen to cellular bands in
the 800 MHz range. Your only option is to buy a old 800 MHz scanner that is
modified or can be modified to listen to that range or buy a scanner from a
foreign country and import it into the country. BTW, it is illegal for you to
import a scanner that is capable of listening to cellular frequencies.

My advice is to buy two radios:

A good shortwave receiver. (I have the Drake R8B, which I like a lot, but there are many good radios.)

A good scanner. (I have a RS PRO-2042, but I'm eyeing the BC 780-XLT when it arrives.)

Keep your Pro-43, it's a great handheld scanner.

Paul, KC2FNC

p.s. I've found that doing a scan on shortwave and uhf/vhf at the same time on the same rig makes little sense. Just my opinion.

'Secure' is relative. I think my home is 'secure.' The gov't thinks
the Gold Depository at Ft. Knox is 'secure.' That doesn't mean my home
has the same physical security standards at the Gold Depository.

If your threat is Joe Scannergeek a couple dooors down from you, then
yes, a cordless phone utilizing spead-spectrum (FH or DS) provides a
relatively high degree of transmission security.

If the threat is a private investigator, the cordless phone link is
still relatively secure, but the conversation isn't, since he/she could
easily tap the wires that provide your home with telephone service.

If the threat is a local law enforcement agency or sophisticated
hacker, the cordless phone link is marginally secure, but the
conversation isn't, since he/she might be able to tap your conversation
at the switch.

If the threat is a federal agency, the RF link isn't secure, but of
course it'd be easier for them to just tap/trap/trace from the switch.

> Does
> a cordless phone with Frequency Hopping Spread Spectrum Technology mean
> it's digital too?

I believe that's almost always going to be the case, yes.

Security is a relative term. There is no absolute security. In the scheme of most unencoded and unencrypted cordless telephones, this is a relatively secure method of communications.

Frequency Hopping is where you very rapidly hop across many channels in a randomized fashion. You could do this with either an analog or a digital signal. In most cases, however, if someone goes through the trouble to spread a radio signal, it is often digitally encoded as well. But these are really two different issues.

I have a Sanyo 900 MHz DSSS phone. It's digital and it uses direct sequence spreading. It could be intercepted with a similar DSSS phone in the immediate vicinity. I'm not too concerned about this because I live on a small farm from where the signal doesn't radiate far enough to be easily received by my neighbors.

>How does spread spectrum work? (I'm not new to radio, just SS. So a
>technical explanation is preferred. <g>)

The easy answer is that spread spectrum scatters, smears, or "spreads" a signal across a wide range of frequencies using a pseudo-random sequence or "chip." The goal is usually to make a signal easier to hide from detection and interception. These techniques can also be used as a form of multiplexing.

There are three basic kinds of spread spectrum. Two of them are well known, one is often overlooked. The first one is frequency hopping. That's where you have a set number of channels which you hop from one to the other in a pseudo-random manner. The signal is recovered by having a receiver follow the transmitter from channel to channel. The goal is not to spend enough time on any particular channel so that the signal is noticed.

The second one is direct sequence spread spectrum, where you basically smear the signal by modulating it with a very rapid pseudo-random signal, such as a rapidly repeating digital word. Here, one expects to ride close to the noise floor and hide the signal by making sure that it is so wide that nobody really notices the slight rise in noise floor.

>What's the difference between frequency hopping spread spectrum and
>direct sequence spread spectrum?

Frequency hopping changes the channel rapidly and direct sequence modulates the signal with a wide band signal.

The third and often overlooked method is time domain spreading. This is mostly a pseudo-random rate applied to a series of pulses. One could modulate these pulses by either phase or amplitude. This is what is commonly referred to as Ultra-wideband spread spectrum.

>Do digital phones use standard FM transmissions with "digital audio"
>or is another emission type used altogether?

I need more information about this: which digital phones are you referring to? The PCS phones or cordless phones? If you're talking about cordless phones, they use all sorts of methods. For details on PCS phones, see Qualcomm's web sites and patents.

>I've never seen advertised a digital phone whose bitstream was
>encrypted. I take it no such phone exists (for the public)?

True, but the main reason such things don't exist is because the technology is a more expensive than most folks are willing to pay for at the moment.

>Hope this isn't too many questions at once. Many thanks.

This opens up a very detailed study of several fields including information theory, fourier analysis, coding schemes, and so on. If you'd like a very introductory and practical reference, try the ARRL's Spread Spectrum Handbook.

Makes sense. Then I take it that this type employs plain old analog NFM (which, of course, hops)?

By the way, while scanning the 902-927 MHz amateur radio band, I sometimes accidentally run into cordless phone transmissions. And, in some of those, I have noticed a 'ticking' sound; approximately 3-6 clicks per second at dead even intervals (and of durations I'd estimate to be only milliseconds long). Could that phemomenon be another phone user's FSS transmissions as they repeatedly/momentarily hop to and "step on" the transmissions I'm receiving? (I hope that makes some kind of sense.)

> The second one is direct sequence spread spectrum, where you basically

So then it's nothing more than an ultra-ultra-ultra-WFM style signal, for a lack of better words? If so, then I guess the only question I have is why said signal would be hard to detect it. For instance, a scanner tuned to a WFM signal in NFM mode still hears a full quieting signal (even though any modulation will over-deviate like crazy). So, wouldn't the same effect happen here (with DSS)? Or does a signal's apparent strength simply go down

as your receiver bandwidth decreases (compared to the transmission itself)? That's my only guess; perhaps the difference isn't noticeable between the bandwidths of NFM and WFM, but NFM versus 902-928 MHz, well ... <g>)

Hmmm. I think I'll have to refer to that ARRL book you've recommended before I can comprehend this one. <g> I'm familiar with amplitude and phase modulation, but "pseudo-random rate" is somehow throwing me off.

Cordless. For instance, many law agencies' digital systems are just NFM analog emissions with digital audio--much like digital modem talk on an analog telco line. So I'm curious if this is what cordless phones do, or if they instead (for example) use some kind of PCM modulation (the pulses representing the bitstream, thus creating a "digital" emission rather than an analog one).

> >I've never seen advertised a digital phone whose bitstream was
> >encrypted. I take it no such phone exists (for the public)?
>

> at the moment.

Really? Knowing the consumer electronics industry, I'd have figured they could easily offer an "encrypted" model using nothing more than the output of a pseudo-random number generator. (E.g. add the psuedo values to the real bits and subtract them at the other end; hardly very good encryption, but sufficient to legally advertise the phone as "encrypted.") Anyway, point is, since such a cheesy "encryption" scheme is so easy to do, I'm just surprised they haven't done it. :-) I wouldn't think it'd take more than a chip that could add/subtract with some pseudo-number generating firmware on board.

Anyay, thanks very much for the informative response.

So you are calling myself and 3 other hams who heard you liars because we
didn't bother Jon with it? Sorry Corky, you little straw man once again
falls down.

> Since HE is the licensee of that repeater, you had better talk to him.

I do quite often Corky. He has given myself and a freind provate use of a
440 repeater he owns. We don't talk about obscene nurses aides that tried
jamming his repeater with profanity years ago. I will next time I talk to
him Corky. I am sure we will get a big laugh out of the adventures of Corky,
nurses aide, ham radio license salesman and repeater smoker.

> All
> you are doing here is flapping your gums & telling more of your lies!

No Corky, I verified what Dan N7ZXL posted and you challenged him to verify.
Fout people witnessed and verified your abusive and illegal use of the 523
repeater. You are the only one that says it is a lie. Gee, who do we believe
Corky? Corky the liar nurses aid or 4 hams that have nothing to gain by
lieing?

Best you concentrate on those legal problems your father posted about.

Glenn

I have a FT-50RD (the deluxe version) for sale. Excellent physical and operating condition (9.5/10). Comes with original receipt, box, antenna, handstrap, NC-60b wall charger, FTT-12 keypad, CTCSS, DCS Enc/Dec, Digital Voice Recorder, and FNB-41 9.6v 600mAh rechargable battery. I also have an extra antenna I will throw in, and a SMC adapter so you can hook an external (whip) car antenna to it.

Price: $200 + $10 shipping (I prefer to use UPS ground).

Email me directly if interested: bcsw@home.com

>(which, of course, hops)?

I think you're confusing yourself (I like John Doty's sig line!). NFM
is NOT like hopping. Imagine running a CB radio and talking while
turning the channel knob from 3 to 28 to 5 to 39 ... Your signal
would hop across the CB radio band. Now imagine that somehow someone
else knows exactly when your channel knob will be on each given
channel and they listen in sync while turning their channel knobs.
This is frequency hopping. It is independent of modulation. You
could do this with FM, AM, FSK, QAM, you name it...

>By the way, while scanning the 902-927 MHz amateur radio band, I sometimes
>accidentally run into cordless phone transmissions. And, in some of those,

>long). Could that phemomenon be another phone user's FSS transmissions as
>they repeatedly/momentarily hop to and "step on" the transmissions I'm
>receiving? (I hope that makes some kind of sense.)

Yeah. It does. You're hearing one of those direct sequence cordless
phones resynchronizing with the base unit. They save power by not

transmitting all the time. Instead, the base periodically transmits a
burst to keep the set locked online and in synchronization.

>> The second one is direct sequence spread spectrum, where you basically
>> smear the signal by modulating it with a very rapid pseudo-random

>as your receiver bandwidth decreases (compared to the transmission itself)?
>That's my only guess; perhaps the difference isn't noticeable between the
>bandwidths of NFM and WFM, but NFM versus 902-928 MHz, well ... <g>)

Well, not exactly. The difference is that you'd unscramble the spread
signal to recover the original signaling. It's sort of like
modulating (or demodulating) the modulated signal. THAT'S what
spreads it. And it's worth noting that when despreading a signal of
this sort, any narrowband stuff within the pass-band appear spread to
the signal recovery. So, not only do you recover your own signal, you
also spread the other narrowband signals.

Basically, spread spectrum techniques are all double modulated
signals. One modulation step is for your information to get on a
carrier wave somehow, and the other step is for your carrier wave to
get spread all over the place. When receiving, you despread the
signal and then you can detect it normally in your IF stage.

>>> What's the difference between frequency hopping spread spectrum and
>>> direct sequence spread spectrum?
>>

>
>Hmmm. I think I'll have to refer to that ARRL book you've recommended
>before I can comprehend this one. <g> I'm familiar with amplitude and
>phase modulation, but "pseudo-random rate" is somehow throwing me off.

Imagine that I tap a spoon on the table with a certain rhythm. You
know that rhythm in advance. You'll be able to tell if I'm late or
early on each tap. The transmitted information is in the late/early

transitions. That is called phase modulation. Amplitude is loud and
soft taps. Now, instead of tapping a spoon, imagine a machine that
spews a wide-band pulse with a rapidly repeating "rhythm."

That's the essence of time domain spreading.

Mine uses PCM and spreads it with a directly applied sequence. It's
designed for the 902-928 MHz ISM band (which is also a ham radio
band).

>> >I've never seen advertised a digital phone whose bitstream was

>just surprised they haven't done it. :-) I wouldn't think it'd take more
>than a chip that could add/subtract with some pseudo-number generating
>firmware on board.

Encryption or encoding? Encoding is easy and is common. Some phones
do really easy and dumb things such as speech frequency inversion.
(It sounds exactly like tuning in a sideband signal with the wrong
sideband setting)

Encryption is not a one for one symbol replacement (as you would have
with encoding). Rather it's a continuous ciphering scheme. Examples
of encryption schemes are DES, PGP, and other such schemes.

>Anyay, thanks very much for the informative response.

You're welcome...

FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner. The author writes a monthly
"Scanner Equipment" column for Monitoring Times magazine,
published by Grove Enterprises, but views expressed in this
article are his own.]

I am often asked, "How do you find these frequencies?"
This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Examine the Antenna to Determine Frequency Band
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies
is the Police Call Plus, published each year in 9 regional
volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Other frequency web sites include:
http://www.fordyce.org/scanning/ and
http://www.scannerway.8m.com.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or

anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the

channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have

the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus

service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

2246. Help, Cooked resistor in AR8000

Newsgroup: rec.radio.scanner
Date: 2000-08-02 00:00:00 UTC
From: greg.m@mindspring.com
Message-ID: <greg.m-ya02408000R0208001749200001@nntp.mindspring.com>
Source record: 83413

Hello,

Recently had a friend (once had) who said that hooking my 8000 to a jack for computer control would be no problem. Well I think, Actually pretty sure, he fried the resistor. My question. Is it fixable? Where to send it? And what type of surface mount resistor is it. It is the resistor in the middle above the flat cable plug for use with the Opto CX12A. Any help would be greatly appreciated. BTW, the radio works pefectly with the exception for not being able to use my flat cable connector

Thanks
Greg

Hi all,

I have a Pro-39 Scanner that I have for sale. It features auto scan of 200 channels at 25 channels per second. Scans the following frequencies: 30-54mhz~ 6m Ham~ 108-136.975 ~ 137-174 mhz~ 380-512mhz~ 806-823.9375mhz~ 851-868.9375mhz~, and 896-960mhz. I've been told other special frequencies are available with simple modifications to this scanner; however, I have not tried these modifications.

This scanner includes the wall AC adapter. I do not have the manual for this, but info is available on the Radio Shack web site.

Please e-mail any reasonable offer to: mt_goodrich@yahoo.com

Final agreed upon price will include shipping from the D/FW area.

Thanks!!!!

Mike

This is the exact problem I am having with my brand new Pro-92A (20-522A 05A00). Every once in awhile I receive a trunked transmission but no ID shows up, until I hit manual then an ID will be diplayed. This is frustrating, when no ID shows up it will not let me hold on the ID/conversation, and these are valid talk goups that for the majority of time I receive fine with the proper ID. I am very tempted to return it and just wait it out for something better to show up in a year or two.

2254. frequency counter on airplane

Newsgroup: rec.radio.scanner
Date: 2000-08-02 00:00:00 UTC
From: JA Moran <john@analon.com>
Message-ID: <3988CF1A.75CF0B0B@analon.com>
Source record: 83421
Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.travel.air

I got a new toy.. It's a frequency counter. took it with me on a recent road trip and found the frequencies used by people passing who were talking on their mobile phones or 2-way radios.

On a recent flight, I had the counter with me and found lots of celular frequencies in the 820-840mhz (mobile side). The towers transmit in the 870-890mhz range

A guy in a row in back of me called his office on his cell phone... My counter lit up with an 841mhz frequency. someone across the aisle used theirs and it showed a 843mhz frequency.

There is a conversion table available....showing hte corresponding tower frequency for a mobile phone
given you know the mobile or phone transmit frequency.

A catering company rep came onboard to check on something..... they used their radio and I got that frequency too.... something in the 466mhz range.

I did not get the ATC frequencies the plane was transmitting on due to the metal skin of the aircraft....
I did however come across some HF frequencies that popped in the counter as the plane was waiting for clearance.

I have a frequency directory and database..... looked up the clearance and tower frequencies and monitored them while on board.... One of the flight attendants on the flight is a flight instructor
and instructs at the FBO at the Phoenix airport..... he usually flies in 172's and 210's (Cessna)

All,

I am considering upgrading my SC150 to a SC200. I like the alpha numeric feature, the extra 100 channels, and the PC interface option. However, after some research I found out to import frequencies to the scanner from my PC (database / spreadsheet) you need some additional third party software. The software that you can download from Uniden will only upload frequencies from their database. I believe the third party software is called Winscan Sport. Is there a place on the web where I can download a demo I want to make sure that this software will actually do what I want before I sink $200 in the scanner and probably another $50 in Winscan Sport. I hate it when companies do this why not include all the software with the scanner!!

Also anybody have any comments on the SC200?

TIA,
Bryan

I seem to recall differently -- that while one side of the RF link was
spread, the other side was stationary & analog for some of the earlier
Panasonic dual-band Gigarange phones.

Message-ID: <3988DFE7.8053BA1A@megsinet.net>
Source record: 83426

I forgot to mention that the 1979 vintage BC 211 has
18 channels and covers 32 - 50, 146 - 174, and 420 - 512 MHz.
It wasn't very popular.

For $50 - $60 more, one could buy the BC 220 and get 20 channels
in two banks, air band coverage, and air and marine Service Search.

More mendacity! The proof is in the snide and unfeeling remarks your
made immediately prior to and shortly after Bill Cheek's passing. Your thinly
veiled glee at his demise and insincere professions of sympathy coupled with
offhand remarks that typify the expression "damned by faint praise" were here
for all to see. You're a liar and a sick net-pest who seeks validation by
misbehaving in the most repulsive and outrageous fashion. We all can see your
twisted glee in these phony professions of innocence. You're the kind of
worthless net-monkey who hides behind the "you can't PROVE I meant it that way'
kind of defense. We know you for what you are. By all accounts here apparently
the local authorities do as well. Want to discuss that, John? I'd like to know
YOUR side of the story - all I hear is the accusation other hurl. come on, John;
others want to know the story.

> Dan, I'll meet you anywhere anytime you would like to arrange a mutually
> agreeable
> place, I CERTAINLY have NO reason to "run" from you!!!! BTW - the owner and
> licensee of the 5.23 Lake Tapps repeater (Jon Marcinko) has told me in
> person that there
> has never been a problem with my activities on any of his repeaters, ...

He didn't hear you do it and therefore chose not to pursue it. Not that
it would do much good, anyway. The point here is that you are the kind of person
who abuses his ham license, maliciously interferes with others' use of a
repeater and makes threats of physical violence via the same then "runs for the
border" before he can get taken up on it. As far as a meeting is concerned,
you've got my QTH right in the sig. How about telling everyone where we can find
you on almost any evening at home, John? I know that most night's you're at work
licking bed pans but just in case I get up to Portland this fall and haven't
anything else to do after dinner at the Ringside and a couple hours browsing in
Powell's, I might like to look you up. come on, tough guy' tell us where to find
that rock you hide under.

2266. Democratic Convention Freqs

Newsgroup: rec.radio.scanner
Date: 2000-08-02 00:00:00 UTC
From: Michael Kellogg <Michael@kelloggs.org>
Message-ID: <soi0aub3dbm166@corp.supernews.com>
Source record: 83433

OK, it's almost time for the democratic convention in downtown L.A. My building is at 9th and Figueroa, so I'll get to wade through an awful lot of protesting, police blockades, and other fun for a few days.

Anyone have any thoughts on LAPD, Secret Service, and other involved parties as far as frequencies, procedures, tactical issues, etc.? A good comparison would be the Republican convention going on right now in Philly.

Michael Kellogg
Diamond Bar, California

This maybe a dumb question but here goes.....Is it possible to put text on the forth line of the scanner....the picture on the box of the scanner shows text on the 4th line.....if so how do you put text on the 4th line...I can only put text on the 3rd line..Thanks....crimson.tide@gte.net

2272. Austin TX Proposed Trunked Public Safety System

Newsgroup: rec.radio.scanner
Date: 2000-08-02 00:00:00 UTC
From: Robert Barker <rbarker@austin.rr.com>
Message-ID: <CVKh5.2287$AE1.38177@typhoon.austin.rr.com>
Source record: 83461

These are the frequencies LICENSED for Austin Tx proposed Public Safety System. Even though they are LICENSED, it does not mean that all of them will be active. LCRA licensed much more than they are using. I have not gotten an official date but possibly not until 2001. The system is supposed to be digital but (then again) so was LCRA's system before they found out digital did not work for them. . This is one part of a major Multi-Million Dollar project which involves new CAD Computer Aided Dispatching and a New Dispatch Center off 51st Street by the old Airport Hangers. This as of 8/1/2000 rbarker@austin.rr.com

Why do you choose to be anonymous?

<Anonymous> wrote in message news:05gr8028t48g042@rec.radio.scanner...
> Since I've found no FAQs, I'll just ask here:
>
> How does spread spectrum work? (I'm not new to radio, just SS. So a
> technical explanation is preferred. <g>)

The phone has a wide range of freq to use. Most are digital. The old phones
used to be analog.

>
> What's the difference between frequency hopping spread spectrum and
> direct sequence spread spectrum?

It says it right there. Hopping means it goes to any random freq in its
range. Direct is it follows the freqs in a row. Never random.

>
> Do digital phones use standard FM transmissions with "digital audio"
> or is another emission type used altogether?

Not really sure on this one.

>
> I've never seen advertised a digital phone whose bitstream was
> encrypted. I take it no such phone exists (for the public)?

Same as last one.

The conversation is DIGITALLY BROADCAST across the spectrum. You won't
hear any words as you might with an ANALOG signal. Bet your neighbor is
not using an AT&T 9400.

Im looking for frequencies for Poughkeepsie NY, dutchess
county. Specifically pertaining to frequencies used by Marist
College.

I used to have the frequencies, but that was two years ago, and i lost
the memory on my scanner. I never bothered to write them down! I
have no clue what frequences they were, and i cant find them online.

Anyone able to point me in the right direction?

If you work for a Cell carrier you can purchase all kinds of cool cell scanner type radios. We have an old analog one that has follow so when the call hands off it jumps to the channel they switched to. But it aint cheap and you have to work for a Cell carrier.

Or you can get a OKI-900 and a CTEK cable and do the same thing for about
$300 to $400 tops!
But of course..... that would be illegal :-)

trunk trackers ain't crap!

Oh don't tell them that!
Remember.. they also think that digital astro can't be monitored.

I won't tell if you don't tell.

>
>Chris N2OGM
The PCR1000 and its little brother the PCR100 [No SSB/CW] are very nice
radios. I own two of the PCR1000. The scan rate will depend on the PC that
you use to "drive" it. Icoms software, while stable and bug free, is a dog.
IT is very CPU hungry and will hog most of the CPU time even on a fairly
fast 233/MMX syste, There are freware, shareware and commercial 3rd party
control software that are much less demanding. there is even one that will
run on any old [back to a 8088]MS-DOS box. Rich Wells Strong Signals has a
very fair review and is a good place to start ferreting out resources.
Good luck!

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a team of G-men protect the president while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some models, like the early Uniden SportCats and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $1500 Icom R8500 and $2000 AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC895XLT, BC245XLT, SC200, and Radio Shack PRO-91 and PRO-94 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites. The ICOM IC-R2 and Yaesu VR-500 are the two smallest "pocket" scanners which perform. Both are tiny enough to fit comfortably in a shirt pocket so you can monitor without attracting undue attention.

Looking for value? At $170 discount price, the 100 channel Uniden/Bearcat BC278CLT base is a good value and available at most Sears and Best Buy stores. The Uniden Sportcat SC200 portable performs very well is an excellent value at its $220 street price.

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your

scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, http://www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance. The Premier (Prime) RD-9 and RD-9SMA are about the same length but even thinner.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas. The Austin Condor is available from Grove Enterprises.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna Co., Inc. and is designed to cover both the 2 meter

and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A (available from Amateur Electronic Supply) or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (828)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove-ent.com

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is http://www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. Modifying any scanner to receive cellular phone signals is now considered illegal. By federal regulation, new scanner models must be designed to they cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/hamradio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the

Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 7825 Black Street Rd., LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial

broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 828-837-9200, http://www.grove-ent.com) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the

public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM. The PerCon Spectrum CDROM sells for under $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM, too.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes an extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an

invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at

the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

Other scanner mailing lists include: scanner@onelist.com, scan-l@onelist.com, scanner@qth.net, and sonofrcma@onelist.com.

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about

4 PM. You must purchase a lunch since we get the room for

- 2 -

free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

All 1999 meetings (except August) will be held on Saturdays at Phillies Pizza, 6300S. Kingery Highway, located in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook, IL,

The 1999 meeting schedule is: April 3, June 5 (picnic at Argonne National Labs), August 7, October 2, and December 4.

The CARMA Picnic will be June 5th, 1999 at the Argonne National Labs Picnic Pavilion, Cass Avenue, south of I-55 in or around Darien or Lemont. The picnic will start whenever someone arrives. The regular meeting will be in the Pavilion at 1:00 PM. If the weather is totally frightful we also have a room inside the Laboratory building available for us.

The Picnic is BYOE (Bring your own everything) If you want to eat or drink, bring it with you, as well as your BBQ or six pack.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 2000 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation sells crystals, antennas, power cords, owner's manuals ($11 ea) for some older (pre-Uniden) Bearcat scanners. Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229, email: electra@tcon.net,

I cannot furnish schematics, manuals or parts. To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553. You can also download an electronic copy of the user manual for recent Bearcat models from the Uniden web site:

http://www.uniden.com/docs/service/support.htm

Some schematic diagrams may be obtained from Uniden's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com |

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor

controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Matt Roberds fixed a BC220 which experienced memory loss if power was removed by resoldering the positive wire to 2-AA battery holder.

As built, the BC220 logic board is grounded only through its mounting screws. In the BC220, Matt recommends adding real wire ground jumpers from the main board to the feature (logic) board to fix grounding problems.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. See March 1996 Monitoring Times magazine for BC800XLT capacitor locations and repair information.

The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig and Karl Klein repaired their BC210XWs by replacing the 22uF/35V C98 capacitor.

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This display is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of

a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Matt Roberds repaired the Montgomery Wards version of a BC220 and contributed these insights:

"I did add some heat-sinks, but you have to be careful what you do with the TIP29 on the logic board. I added a long, flat heatsink to it and immediately created a whine in the audio. I didn't use an insulator, as this was a temporary first-try. As far as I can tell, the heatsink was radiating noise from the logic board into the front end on the radio board, which ended up being just below the heatsink. Bypassing the TIP29 (a voltage regulator) with disc ceramics didn't work; using a smaller heatsink and an insulator fixed the problem."

"There is also a 220 ohm 1/4 watt resistor on the logic board. It feeds the TIP29 from the main +16v supply. It looked a little crispy. I pulled one end and measured the current through it and it was about 30-35 mA. This works out to right at 0.2-0.25 watt dissipation. I didn't have a higher-wattage resistor, so I substituted 2 470-ohm resistors in parallel."

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to

switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. Gary Bean reports he substituted a 2SA1298 for Q201 and it worked fine. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Replacement Bulbs for BC760XLT

The Uniden BC760XLT's SCAN, MAN, PRI, and HOLD buttons are illuminated by "grain of wheat" type incandescent bulbs. Gary Saffer reports that the bulbs and buttons are located on a small printed circuit board which sits behind the radio's face plate. Gary unsoldered the burned out bulbs in his radio and replaced them with 12 volt Radio Shack bulbs (#272-1092c). They should last a long time when powered by the 8 VDC supplied by the BC760XLT.

Open Resistor in BC140

Robert Casey fixed his deaf, 16 channel Bearcat BC140 scanner. A 10 ohm resistor had opened that fed a circuit that generates 22V for the varactor diode tuner circuits. Without the 22V, there was no tuning of the local oscillator and front end, and no reception. What he did was compare voltages to a second working BC140.

Sources for Replacement NiCd Battery Packs

Replacement NiCd battery packs and inserts for the BC100XLT, BC200XLT, BC2500XLT, BC3000XLT, and other scanners are available from Uniden. I've purchased them at lower cost from:

1. Mr. NiCd - E. H. Yost and Company, 2211-D Parview Rd., Middleton, WI 53562. tel. (608)831-3443. email ehyost@midplains.net

2. Battery-Tech Central, 2818 Southland Street SW, Cedar Rapids, IA 52404-4141. tel. (800)267-3087 or (319)364-0855.

Batteries Plus has stores across they country and some have rebuilt Uniden NiCd packs for under $20.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426

You need not bother with calculating the crystal fundamental frequency. Merely supply International with the exact receiver model number, printed on the rear label, and the frequency you want to monitor. They will perform the necessary calculations.

Crystals for Plectrons

The Plectron P1 series contain two crystals. The second local oscillator crystal is 11.155 MHz regardless of band. On VHF high band (148 - 175 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz)
= (station freq (MHz) + 10.7) / 4

or

Crystal frequency (MHz)
= (station freq (MHz) - 10.7) / 4

On VHF low band (25 - 54 MHz), the P1 series employ this formula for the first local oscillator crystal:

Crystal frequency (MHz) = (station freq (MHz) + 10.7)

or

Crystal frequency (MHz) = (station freq (MHz) - 10.7)

There are two crystals (Y1, Y2) used in the Plectron R700 series, one for each local oscillator. The crystal formulas are:

RF Range (MHz) Y1 (MHz) Y2 (MHz)
_____
25-29 (f+10.7)/3 11.155
29-32.6 (f+10.7)/3 11.155
32.5-35 (f-10.7)/2 10.245
35-41 (f-10.7)/2 11.155
41-47 (f-10.7)/2 11.155 (use 10.245 MHz
for Y2 on 44.62 MHz)
47-54 (f-10.7)/3 11.155
148-158 (f-10.7)/9 11.155
158-175 (f-10.7)/9 10.245
450-470 (f-10.7)/18 11.155

The economy Plectron 500 series use this scheme for the first local oscillator crystal:

RF Range (MHz) Crystal (MHz)

---

25 - 35 (f+10.7)
35 - 54 (f-10.7)
148 - 174 (f-10.7)/4

Most Plectron 500s use an 11.155 MHz second local oscillator crystal. However, a 10.245 MHz crystal is used instead for receivers in these ranges: 33.4 - 33.78, 44.62, and 158.78 - 158.82 MHz.

Power Cords

AC power cords for both types of receivers use unique connectors and are scarce. I published the pinout for both Plectron and Motorola Alert Monitor receivers in June 1998 Monitoring Times magazine.

You can buy the proper replacement power cords but it's much cheaper to drill a hole on the rear panel and solder on a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

Squelch and Minimum Volume Setting

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely

silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760
email: weber@citizen.infi.net

Alert Monitor parts are available from Motorola. Phone (800)422-4210. The part number on the service manual for my VHF-high band monitor is 68P81048A55-G and my VHF-low band manual bears part number 68P81050A95-D.

John Miller reports the current price is $5.70 for service manuals. Motorola advised John that Alert Monitor parts are scarce, with last stocked being in 1995, Knobs are no longer available, though there are many that would fit.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and feature priority scan and a separate trimmer capacitor for each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X

SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from the crystals used in the conventional single channel Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) / 10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

Plectron Alternatives

Too bad Plectron is out of business. TCS Communications Corp. sells used Plectron receivers, in working condition, for $75-100. If you require crystals or reeds, TCS may be able to find some types/frequencies. Contact:

Terry Marengi
TCS Communications Corp.
tel. 1-800-TCS-XMIT
email: TERRYTCS@aol.com

If you wish to purchase a new receiver with "Plectron-like" signaling capabilities, contact Reach Electronics:

Reach Electronics
1311 West Pacific
Lexington, NE 68850
(308) 324-6661
(800) 445-0007
FAX: (308) 324-4985

Reach sells tone & voice pagers, Alert monitors, and ENCODERS. They also do contract manufacturing.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1999 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the
RCMA Newsletter, December 1988. It may not be reproduced
in whole or in part on CDROMS, in bulletin boards,
networks, or publications which charge for service without
permission of the author. It is posted twice monthly on
the USENET groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is
difficult to use because of too much hysteresis. The
American Heritage Dictionary of the English Language
defines hysteresis as the:

o "Failure of a property changed by an external agent
to return to its original value when the cause of the
change is removed."

It's like having play in a car's steering wheel, or
backlash in a gear set. Too much hysteresis in a squelch
circuit forces one to keep the squelch at a tighter
setting, missing weaker signals when scanning or searching.
The squelch hysteresis problem was first addressed in a
1984 article about the Radio Shack PRO-24 crystal
controlled scanner.

Why do engineers design these circuits with any hysteresis?
Basically, hysteresis prevents weak signals from "popping"
the squelch open and closed rapidly, which would be very
annoying to the listener. A squelch circuit with hysteresis
requires a stronger signal to open the squelch than it does
to keep it open.

Models cursed with too much hysteresis include the
Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003,
PRO-2004, and others. Don't despair, the fix is simple for
most radios. I've successfully reduced the squelch
hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

4. If space permits, you can replace the stock resistor with a higher value variable resistor ("trimpot") and adjust to suit.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 - 2000 by Bob Parnass, AJ9S |

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

I cannot furnish schematics, manuals or parts. Service manuals for most Radio Shack scanners sold through mid-1997 may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.samswebsite.com |

Parts lists for recent and many older models are available on line at: http://support.tandy.com. Parts may be ordered through Tandy National Parts, telephone (800)241-8742, or through your local Radio Shack store. You may be able to obtain some technical assistance from Tandy by calling (800)843-7422, option 2. The RSU (Radio Shack Unlimited) phone number is (800)-433-2024.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004, but Robert Cummings has modified an LCD from a Miller Engineering (http://www.microstru.com) experimenter's kit and fitted it to his PRO-2004. See http://home.cfl.rr.com/scan/Backlight.html for details.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the

squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad (PRO-43 keypad is RSU#10789808) may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

PRO-7A: Channels 1 - 4 or 5 - 8 Dead

If the first or last 4 channels in your 8 channel PRO-7A
crystal scanner are not working and the lamps for those
channels won't light, replace IC4 or IC5 (type 7400A).

library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

You may share information with scanner collectors via the
"vintagescanners" mailing list at:

http://www.onelist.com/group/vintagescanners

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements

Jul 1996 - Uniden/Bearcat BCT-10 mobile
Aug 1996 - BMI Nitelogger II tape recorder activator
Sep 1996 - PRO-2022 modifications
PRO-2042 baseband audio tap
Oct 1996 - Radio Shack PRO-2046 mobile
Nov 1996 - Build a wooden mobile radio mount
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jun 1997 - Innovative Scanner Patents of the 1970s
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC895XLT Trunktracker
Jan 1998 - Test Equipment Bargains
Feb 1998 - Innovative Scanner Patents of the 1980s and Beyond
Mar 1998 - RELM MS-200 mobile
Apr 1998 - RCA RP-6150 portable
May 1998 - Radio Shack PRO-2050 base Trunktracker
Jun 1998 - Opto DC442 CTCSS/DCS/DTMF display
Jul 1998 - Stub and Par Electronics intermod rejection filters

Aug 1998 - Sony SC1PC portable
Sep 1998 - Orange Book of Scanner Repair
Tone Out Testing (2-tone generators)
Monitoring ACSB (amplitude compandored side band)
Oct 1998 - AOR AR8200 portable
Nov 1998 - Alinco DJ-X10T portable
Dec 1998 - Radio Shack PRO-91 portable Trunktracker
Jan 1999 - AOR AR7000
Feb 1999 - Radio Shack PRO-2066 mobile Trunktracker
Mar 1999 - ICOM RS-8500 software for controlling the IC-R8500
Apr 1999 - ICOM IC-R2 portable scanner
Jun 1999 - Mini-Circuits ZFSC-4-1 4-way passive splitter
Jul 1999 - Racing Electronics RE2000 portable
Aug 1999 - AOR AR16 portable
Sep 1999 - Uniden Bearcat BC245XLT portable
Oct 1999 - Plectron R700 series monitor receivers
Nov 1999 - Uniden Bearcat BC278CLT clock radio scanner
Dec 1999 - Uniden Bearcat BC248CLT clock radio scanner
Jan 2000 - Radio Shack PRO-92 portable scanner
Jan 2000 - Stridsberg Engineering FLT201A FM Notch Filter and
MCA-204 Receiver Multicoupler
Feb 2000 - Yaesu VR-500 portable wide coverage receiver
Mar 2000 - Uniden Sportcat SC-200 portable scanner
Apr 2000 - Understanding Intermod,
(comparison intermod performance of several models)
May 2000 - Radio Shack PRO-94 portable
Jun 2000 - Radio Shack PRO-2052 trunk tracking base scanner
Jul 2000 - Electra Tiger Scan TSA portable

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

ALINCO

DJ-X10T: 1998 vintage. Rugged construction - metal back. Multimode frequency coverage 0.1 to 2000 MHz (minus cellular bands). 20 selectable step sizes from 0.05 to 500 kHz. Knob atop the radio clicks when rotated and serves as a VFO knob, channel selector, and menu navigation control. Several battery pack options for NiCd and alkaline battery cases. Furnished with an EBP-37N 4.8 V, 700 mAH NiCd pack and a sturdy 11 hour drop in charging stand. Loaded with firmware features and complicated to use. Two VFOs and 1200 channels in 30 banks of 40 channels each. Memory banks are cryptically designated, though you can scan combinations of banks. Each memory channel can be programmed with the frequency, an 8 character label, attenuator, a skip (lockout) flag, and mode (WFM, NFM, AM, USB, LSB, CW, AUTO).

Very slow 6 ch/sec scan rate. Rescan delay is about 1 second and cannot be disabled or changed. Auto Memory Write stores up to 40 frequencies but does not check for dupes. 20 linkable search banks with labels. Up to 50 frequencies per search bank can be locked out. Digital clock with on/off timer. Battery saver can be disabled. Ability to scan or search for signals above a selectable threshold or channels with a specific mode. Band scope 7 or 40 steps wide. In short, 30 - 1000 MHz sensitivity is good, few birdies and little intermod. WFM broadcast reception very good. The DJ-X10T squelch can be set to one of 10 levels. We had to keep the squelch set to SQ3 or higher, otherwise it opens at inappropriate times, especially when the battery saver is active. The DJ-X10T instruction manual does not specify the IF (intermediate frequency) scheme. Filters inside the DJ-X10T imply 0.455, 10.7, and 45 MHz IFs. Our tests indicate a first IF of 736.25 or 275.45 MHz, depending on the frequency to which the DJ-X10T is tuned. Our DJ-X10T hears images of cellular phone signals clearly in the 1419.9 - 1444.9 MHz range, 550.9 MHz above their actual frequency. For a full review, including technical test results, see Monitoring Times, November 1998.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio,

otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

AR8200: 1998 vintage. S/N 550004 tested. Portable, high end "super" scanner covers 0.1 - 2040 MHz (minus cellular in USA version). Not a scanner for beginners. Many of the settings are made through the use of menus. Lots of features. 4 AA batteries, steel belt clip, plug-in AM antenna. 1,000 conventional channels in 20 banks, 10 temporary channels, one priority channel. Each memory channel may be programmed with frequency, label, mode, step, step-adjust, offset, attenuator enable, noise limiter, AFC, and write protect. Multi bank scanning. You can enable a 0 - 9 second rescan delay with each scan group, but not per channel. 40 pairs of search limits with labels. Offset capability for monitoring repeater input frequency. LCD display easy to read. Display and keypad backlit using green LEDs. The band scope. Shortwave reception stone deaf on shortwave when fitted with the supplied antenna or a 19" whip. Seriously overloaded on shortwave by a 132 foot long dipole unless we use the built-in attenuator. Supplied "dorsal fin" antenna for AM BCB. Scans slowly (14 channels/s). Requires more current. Audio quality is slightly above other portable scanners. Computer port. One slot for a single plug-in option: voice inversion descrambler, CTCSS search, 256 frequency tone eliminator, voice recorder and playback, or extended (slow) memory. See AOR AR8200 review by Bob Parnass,in Monitoring Times, October 1998, for review with quantitative test results.

ICOM

IC-R10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke

sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the

ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/BEARCAT AND ELECTRA/BEARCAT

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion, 254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at http://www.grove-ent.com for a review which includes quantitative test results.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier

vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder.

Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see

"The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

REGENCY

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more

than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RCA

RP-6150: 1997 vintage. No frills, good performing portable. 200 channels in 10 banks. No military aircraft frequency coverage. Triple conversion and a flexible battery arrangement. Lacks duplicate channel detection, search skip, and empty channel lockout features of newer designs. Our sample isn't super sensitive at 470 - 512 MHz and has

some intermod around the VHF railroad channels but is generally more resistant to image problems than the BC230XLT. For technical test results and a review, see "The RCA RP-6150 Portable," by Bob Parnass, AJ9S, in Monitoring Times, April 1998.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. See "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

MS200: 1998 vintage. Made in USA. 200 channel mobile with alpha labels. CTCSS and DCS decoding squelch. Programmable via PC using supplied software. Low contrast, LCD display. Keypad backlit for night programming. Rear panel tape audio jack. Test unit had lots of intermod on VHF-high band. IFs are 280 and 0.45 MHz. See "The RELM MS-200 Scanner," by Bob Parnass, AJ9S, in Monitoring Times, March 1998, for a review which includes quantitative test results.

RADIO SHACK

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range. IF frequencies are specified at 608.005 - 611.2 MHz, 48.5 MHz, and 455 kHz.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod

immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-91: 1998 vintage. Portable made by Uniden for Radio Shack. 150 channels in 5 banks. Can selectively follow conversations in 800 MHz Motorola trunked radio systems. Censors 823.975 - 823.95 and 894.0125 - 896.1 MHz covered by the BC235XLT. Powered by four individual AA alkaline or NiCd batteries. Power save feature. Program key. One priority channel/bank. One search bank. Direct search. Service search omits many police freqs (inc. 460 - 460.5 MHz). While connected to an outdoor antenna, our PRO-91 experiences intermodulation interference in the 161 MHz range from a paging transmitter on 158.1 MHz. IFs near 380.7, 10.85 and 0.450 MHz. See PRO-91 review by Bob Parnass, in Monitoring Times, December 1998, for review with quantitative test results.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners

have no trouble.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they

were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for modifications.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock

out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-2050: 1998 vintage 300 channel Motorola trunk system tracking base made by Uniden. Tight front end. Excellent performance. Chassis-less, plastic construction. Squelch and volume knobs too close and Manual key is hard to find. IFs are 380.7 (approx.), 10.85, and 0.45 MHz. AM and NFM modes are factory set and not selectable. 300 channels in 10 banks and a 2 second rescan delay may be programmed on a per channel basis. Query feature identifies duplicate memory channels. Our PRO-2050 scans at 78 channels/sec., skipping over empty channels. 10 priority channels. Up to 50 frequencies may be locked out from limit search. A single pair of limits may be programmed for a limit search. No Direct key or direct search facility. Factory preprogrammed frequencies for police, fire/emergency, commercial air, public service, and weather, but not marine. See May 1998 Monitoring Times for a review which includes quantitative test results.

SONY

SC1PC: 1998 vintage. Good RF and audio performance. Covers 25 - 1300 MHz, minus cellular phone. Selectable step size and mode. Computer control and downloading with software and PC cable provided. Powered by ordinary AA batteries. Provided CDROM includes both the scanner control program and the multi million record PerCon FCC license database. 10 banks ("pages" in SONY parlance) of 30 channels each. Per-channel 2 second rescan delay. Unlike the ICOM IC-R10, you can scan any combination of memory banks. You can lock out ("skip") memory channels from scanning. The frequency stored in a skipped channel will also be skipped during searches. One priority channel checked every 5 seconds. SONY's limit search is restricted to one pair of search limits, though computer control expands this to 20 linkable pairs. Band search lets you search through 17 bands programmed at the factory. Service search. A cache, termed Intelligent Memory, stores the last 10 unique frequencies that were active for longer than 5 seconds each. IFs (in MHz) are 600 (below 370 MHz), 232.5 (above 370 MHz), 45.0, and 0.455. For a service manual, call SONY at (800)488-7669, and press 3. See "The SONY SC1PC," by Bob Parnass, AJ9S, in Monitoring Times, August 1998, for a review which includes quantitative test results.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

CRAIG (division of PIONEER)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

SONAR

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal

case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes
FR2525	10	X		yes	yes
FR2526	10	X	X	yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

TENNELEC

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

HAMFEST/COMPUTERFEST CALENDAR 2000 - ILLINOIS
last updated July 14, 2000 |

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale, Rick D. Wilson, John Wass KA9QJX, Tom Harker, and ARRL for providing some of the information.

AUGUST 2000

Aug 12 (Sat): Quincy, IL - Western Illinois ARC. http://www.qsl.net/w9awe. Info: Jim Funk, N9JF, PO Box 3132, Quincy, IL 62305-3132. Tel: 217-336-4191 . Email: jfunk@adams.net

Aug 13 (Sun): Peotone, IL - 66th Annual Hamfesters Hamfest. Will County Fairgrounds. 45 mintues from Downtown Chicago, take I-57 to Peotone Exut 327 (East). 35 acres of free parking. 14,200 square feet of exhibits open at 8 AM. Flea market open at 6 AM to 3 PM. No additional charge for flea market space. Rain or shine -six covered pavilions for Flea Market. Tickets are $4.00 in advance with double stub, $5.00 at gate with single stub. Children under 12 free. Advance ticket sales and information: SASE and check by July 25th, Christine Mack, PO Box 2161, Oak Park, IL 60303. tel. 708-358-1786, email: christine1@mediaone.net. Talk in on 146.52 simplex and 146.64-(107.2) Stars Repeater

Aug 19 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Aug 20 (Sun): Orland Park, IL - Giant Computer Show & Sale | (see below). Orland Park Civic Center, 147th St. & Lagrange | Rd. 9:30 AM - 3 PM. Adults $6, children $2. |

Aug 27 (Sun): Danville, IL - Vermilion County ARA. Info: Gary Denison, KA9SKS, 14704 East 2750 North Road, Danville, IL 61834-5610. Tel: 217-759-7389 . Email: gdenison@danville.net

Aug 27 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College

Rd. 9:30 AM - 3 PM. Admission $6, children $2.

SEPTEMBER 2000

Sep 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Sep 16 & 17 (Sat & Sun): Peoria, IL - Peoria Area ARC. Info: Ron Morgan, KB9NW, or John Coker, N9FAM, both c/o: PO Box 3508, Peoria, IL 61612-3508. tel: (309)692-3378. Email kb9nw@juno.com or n9fam@juno.com. http://www.peoriasuperfest.com

Sep 17 (Sun): Orland Park, IL - Giant Computer Show & Sale | (see below). Orland Park Civic Center, 147th St. & Lagrange | Rd. 9:30 AM - 3 PM. Adults $6, children $2. |

Sep 23 & 24 (Sat & Sun): Grayslake, IL - Chicago FM Club Radio Expo. Lake County Fairgrounds. http://www.chicagofmclub.org. Admission $8, good both days. Info: Mike Brost, WA9FTS, 5127 North Monterey Avenue, Norridge, IL 60706. Tel: 708-457-0966, Email: mbrost@cin.net (the biggest and best hamfest in northern IL - AJ9S)

Sep 24 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

OCTOBER 2000

Oct 1 (Sun): Wheaton, IL - Giant Computer Show & Sale (see | below). DuPage County Fairgrounds, County Farm Rd. & Man- | chester Rd. 9:30 AM - 3 PM. Adults $6, children $2. |

Oct 14 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Oct 15 (Sun): Orland Park, IL - Giant Computer Show & Sale | (see below). Orland Park Civic Center, 147th St. & Lagrange | Rd. 9:30 AM - 3 PM. Adults $6, children $2. |

Oct 22 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

NOVEMBER 2000

Nov 5 (Sun): Davenport, IA - Davenport Radio Club. Iowa National Guard Hanger, Mt. Joy Airport. Talk-in 146.88 MHz repeater. http://www.gwltd.com/hamfest

Nov 11 (Sat): Wheaton, IL - Giant Computer Show & Sale (see | below). DuPage County Fairgrounds, County Farm Rd. & Man- | chester Rd. 9:30 AM - 3 PM. Adults $6, children $2. |

Nov 12 (Sun): Orland Park, IL - Giant Computer Show & Sale | (see below). Orland Park Civic Center, 147th St. & Lagrange | Rd. 9:30 AM - 3 PM. Adults $6, children $2. |

Nov 18 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Nov 18, 19 (Sat, Sun): Ft. Wayne, IN Fort Wayne Hamfest & Computer Expo. Allen County Amateur Radio Technical Society. 2000 Indiana ARRL State Convention. Allen County War Memorial Coliseum Exposition Center. Hours 9 AM - 4 PM EST Sat, 9 AM - 3 PM EST Sun. Admission $5 plus $2 parking. http://www.acarts.com

Nov 26 (Sun): Glen Ellyn, IL - Computer Central Show (see below). College of Dupage. Corner of Park Blvd. & College Rd. 9:30 AM - 3 PM. Admission $6, children $2.

DECEMBER 2000

Dec 3 (Sun): Wheaton, IL - Giant Computer Show & Sale (see | below). DuPage County Fairgrounds, County Farm Rd. & Man- | chester Rd. 9:30 AM - 3 PM. Adults $6, children $2. |

Dec 16 (Sat): Grayslake, IL - Computer Country Expo (see below). Lake County Fairgrounds Exhibit Hall, Rt. 120 (Belvidere Rd.) & Rt. 45. 4 miles west of I94. Admission $6, or $5 with discount coupon available at WebSite.

Dec 17 (Sun): Orland Park, IL - Giant Computer Show & Sale | (see below). Orland Park Civic Center, 147th St. & Lagrange | Rd. 9:30 AM - 3 PM. Adults $6, children $2.

COMPUTER SHOW NOTES

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 847-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm. See http://www.computercentralshows.com web site.

Giant Computer shows are held by Micro Media, Inc. Shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $6. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123. See http://www.giantcomputershow.com

Computer Country Expo is Lake County's largest computer
expo. The event is held on designated Saturdays from 9:30
AM to 3:00 PM. This show features computers, supplies,
games, parts, software, accessories, CD-ROM, monitors,
diskettes, printers, keyboards, modems, disk drives, cables,
expansion boards, services, etc. Lake County Fairgrounds,
Route 120 (Belvidere Rd.) & Route 45, in Main Exhibit Hall
Building #1=9720,000 sq. feet. For a show map, exhibitor
info, and discount coupon, visit the web site at
http://www.ccxpo.com.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120

Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the

scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models

are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.

I believe you are wrong about Direct Sequence. It does not jump from frequency to frequency in a row. It does not even jump from frequency to frequency. It spreads the signal over a broad spectrum simultaneously, it uses a code or "chip" to spread it over the broad frequency. To learn more there is a book "The ARRL Spread Spectrum Sourcebook" which goes into great detail.

Oops, I stand corrected, and agree that it's an amazing little radio.

I mistakenly assumed that it was dual conversion because I sometimes
hear mine suffering from interference from pager towers and the like
on FRS frequencies and police frequencies in urban environments. I
should have checked the specs more carefully.

This statement reminds me of a reporter responding to the report
of a bomb threat by showing up at the scene and using his cellphone
to file a report. An officer points at the sign clearly pointing
out "Bomb Danger, no Radio Transmissions Allowed", but the reporter
protests "It's not a radio transmitter, it's a cellphone".

Of course, this story is probably wasted on you, since you never
realized that a cellphone *is* a radio transmitter and probably
refuse to acknowledge it still.

Tim.

More important is that people realize that the pilots use a radio transmitter to talk to the control towers and they don't cause the plane to crash either. The ONLY reason cell phones aren't allowed on planes is that your cell phone will be able to transmit to cell sites all across the country at the same time. A handheld walkie-talkie on a plane over Texas talked to me on my walkie-talkie on the ground in Illinois. No cell phone, cd player, or any other consumer device is going to affect or cause any plane to crash or terrorists would not have to try and sneak bombs onto planes, they could just bring a cell phone on board, and when the plane is off the ground, turn on the cell phone and crash the plane.

To date, no plane has ever crashed due to a cell phone or cd player.

Good question. I just bought a Pro-89 and the manual clearly states that it can be "wire programmed" by hooking it to a computer. There is no connection port on this system, and the salesman was clueless. He called RS HQ while I waited, and they couldn't answer the question either. I suspect that neither the Pro-76 or mine actually have that capability. Someone at RS HQ must have been asleep when they sent out for the manual to be printed...

If I'm wrong and this radio can be programmed with a computer please let me know ASAP!

Only in your tiny mind, Toilet Boy. You are so delusional, you can't see the truth: No one likes you, no one believes you, everyone one knows you are a liar and a fraud.

> 2. He was not loved & respected by everyone. (do you need proof?)

Reposting one of your diatribes from one of your fictitious personas blasting Cheek doesn't count. On the other hand, you Toilet Boy, are despised by everyone who encounters you.

Speaking of proof, where's the proof of your claim to have a "Masters of Communication Technology"? Hmmmm, Toilet Boy?

> 3. Why would I be jealous of him? What is there to be jealous of?

Cheek was a real person, you are a loser, a liar, and a fraud.

Cheek had real technical ability, you have none. Zero. Nada.

Cheek was a stand up guy. Whether you liked him or not, you always knew where you stood with him because he was honest. Cheek knew you were a liar and a fraud and he had no difficulty telling you so.

Your whining is not about any supposed copyright infringement. It's
about my story "All Hail King Mackey the Great Liar," and my endorsement
of Mr. Wirehead posting same. You can't stand the fact that the story
makes one point in a delightfully satirical manner:

You, Toilet Boy, are a liar and a fraud.

>> > Does a cordless phone with Frequency Hopping Spread Spectrum
Technology mean it's digital too?
>>

First of all, not all phones which describe themselves as "Spread
Spectrum" are really spread spectrum; they are often "frequency hopping"
and the rate can be rather slow ... like a frequency change every several
seconds or so. This method works with both analog and digital. The older,
cheap, analog phones could be easily monitored due to the limited number of
channels they used, and the duration of stay on each channel.

True spread spectrum is usually digital and involves very rapid
changes over a number of frequencies, each stop lasting well less than a
second. If done properly, the sequence of frequencies to be hopped is
continuously encrypted and never repeats itself. If digital transmission
is used, it's impossible for any hobbyist to monitor, or even hear.

There is nothing to resolve. While traveling through the I-5 corridor in my area John-Cory Mackey got on the 523 repeater cursing, swearing and making threats. Of the 4 people that approached me about it two knew who Mackey was. We all laughed and joked about what an idiot he was and forgot it. Though numerous people have verified John-Corky's actions he still insists it could not have happened because it wasn't reported to the repeater owner. Corky-John's logic, not mine!

The only reason I brought it up is Mackey accused Dam Morisseau of making it up and being a liar, that nobody could verify it. I can say without hesitation, Dan did not lie. Nobody has to about Mackey.

As far a Riley goes, I am sure he has heard of Mackey. It has been reported on here by many including his own father that he is under investigation for selling licenses or some such nonsense.

2329. Best Ericsson System Scanner????

Newsgroup: rec.radio.scanner
Date: 2000-08-03 00:00:00 UTC
From: Jim Bo <jbollit@ix.netcom.com>
Message-ID: <398A5D91.7FA3FE04@ix.netcom.com>
Source record: 83318

Hello,

What is the best scanner on the market that will receive an Ericsson trunked system?

I am new to the concept of trunking and have heard of control channels, banks, etc.

I know the term best means different things to different people, but I have read that some of the earlier scanners had problems with tracking the various groups on a system.

I guess the question should also include, those scanners that are the best also have some drawbacks. What are the drawbacks to the "best"?

Thanks is advance.

Jim

Carl,

I stopped at the Radio Shack in the Staunton Mall and they gave me a list of freqs for this area. I don't have it handy right now, I left it with my gal in Staunton. It was a great list and very comprehensive. Lots of great monitoring, especially VSP.

With the introduction of the Gigaphones, some folks reported that
the 9OO mHz transmission from the handset to the base unit (I
believe it was this way around) was a simple (FM) analog
transmission. However, Panasonic claimed (in a reponse to
etown.com) that both sides (the 900 mHz transmissions from the
handset to the base AND the 2.4 GHz transmissions from the base
to the handset) employed spread spectrum and Pansasonic also
admitted that the transmissions were, in fact, analog. Panasonic
also claimed that some other manufacturers' spread spectrum
phones used analog voice transmissions as well.

I don't think it matters what it signifies to me. It's how the
industry uses the term that counts. Given the lack of standards,
each manufacture can use the term to mean something different.

What freq scanner is it?
I have an Optoelectronics Model 3300 and I don't like it very much at all.
I can stick an antenna right next to it and it will hardly work.

It's only illegal to use them while airborne :) and actually, the FAA doesn't take a specific regulatory stance on the use of cellphones. They may say something about them, but those words of wisdom are not contained in the big fat book of knowledge that every pilot lives and dies by. The FCC, OTOH, has plenty to say if they catch you. But that's a whole different story...

I think this is false. The early Panasonic Gigaphones were
spread spectrum and used analog (not digital) voice
transmission. (Don't know about the later ones.) I think there
are many 900 Mhz spread spectrum phones that also use analog
transmissions, but I couldn't tell you which ones. The fact that
it may have "DSS" labeled on the phone somewhere is no guarantee
that the phone uses digital transmission.

Yep just email me at fedcop@fbi.gov :)

I'll help you out with listening to those active cell frequencies :)

JJ475171 <jj475171@aol.com> wrote in message
news:20000802045940.05711.00000356@ng-fc1.aol.com...
Hello all, Due to the fact that AOL prohibits me from posting messages
regarding the sale of scanners, im posting a message to anyone that is
interested in hearing the cell band to please contact me (Via E-Mail) and I
will present you with the information on a very capable peice of equipment,
that can enable you to receive these extremely active frequencies. All
serious
inquries can contact me directly at my e-mail address (At the top of this
post)
and I will provide you with the proper information. Please be fore-warned
that
I do not check the newsgroup messages daily, BUT I DO check my e-mail on a
daily basis. Thank You all for being patient in reading this post, and best
regards to all.....Frank in CT.

I disagree. As already posted by somebody else, it is illegal to sell scanners capable of picking them up (producing them too) and it's also illegal to listen to them, but what's done is done - I can easily listen to cellular activity on my BC220XLT if I really wanted to. I would have a hard time believing that it's illegal to even own a BC220XLT just because it is capable of picking up those freqs.

Hi!

Anybody know where I could get one of these in the UK please? Tandy do not sell them although I recognise this scanner is very similar (if not the same) as several models marketed around.

It's a nice scanner but would be even better with a case and strap supplied in the box :-(

Jeff
(To email me just take the MICK out of my name!)

The way I interpret the law, it is Ok to sell scanners that can pick up
cell phones, you just can't manufacrure, or import them. This
effectively grandfatheres any scanner you may own so that you can sell
it on the used market.

If ya'll really want to listen to cell frequencies, just move to some country that doesn't have laws prohibiting it. Or elect congressmen who will repeal the existing laws.

So much information, so little time...

The laws as currently written in the United States of America, as per my interpretation:

-selling a used cellular-capable scanner: legal
-selling a newly-manufactured cellular-capable scanner: illegal
-importing a cellular-capable scanner: illegal
-modifying a scanner to receive cellular signals: illegal
-possessing a cellular-capable scanner which has been previously modified: legal
-monitoring cellular signals: illegal

Disclaimer: I am not a lawyer, nor an FCC commissioner, so don't take my word as gospel truth. My opinion and interpretation only is provided herein.

Corky Patrol,

Who do you think you are to be putting someone down for having Down's Syndrome?? And to call him "retard boy"!!! If I heard you say that to someone in person, I'd physically beat you!! God loves those people just as much as he loves arrogant pricks like you. You better check to see if you have a conscience, because it doesn't seem like you have one. I have been on this NG for only a couple weeks now, and I have seen John Mackey do nothing wrong. I have only seen him trying to stick up for himself amidst constant bullying. Even if he has done wrong a time or two, WHO HASN'T??? I came to this NG to read about scanning, not to act like little children and bully people. ALL YOU PEOPLE WHO BULLY OTHERS NEED TO GROW UP AND GET A LIFE!!!!!

1. You are most definitely HATED (Maybe you are just
to stupid to recognize hatred)
2. For the most part Cheek was loved and respected as
evidenced by the comments I have read on this NG
recently. I haven't read many bad comments about him.
Except from you.
3. I said you were jealous of the love he was receiving NOT
of him. And of course you are jealous of this love because
that is why you act out here. You get so little positive
attention in your personal life that you have to come here
and make noise.

Jughead's right--it isn't illegal to own a cell capable scanner; my BC800XLT covers the cell band unmodified; but it is now illegal for companies to make them for use or sale in the United States.

Does anyone have a clue about how to program the Pro-76
with a computer. The manual says to see your local RS.
Nobody at Radio Shack has a clue
Hope you can help
Thanks

I disagree with Ken. THere is no way. It's either modified or it picks up
images and not the true freq.

2363. Cheapest military air scanner (was: What's the best scanner?)

Newsgroup: rec.radio.scanner
Date: 2000-08-03 00:00:00 UTC
From: Richard Cochran <rcochran@lanset.com>
Message-ID: <3989A527.A3616CBC@lanset.com>
Source record: 83379
Cross-posted to: rec.radio.scanner,newsone.log

Handheld or base?

The Icom IC-R2, at $200.00 or so, covers this band and a lot more.
It's not triple conversion, though, and can suffer from interference from
pager towers (I haven't tried using it much on mil-air bands yet, so I'm
not sure how bad the interference is there). It's a really tiny handheld.
I'm very happy with mine.

I also have an old Pro-2004 which does a really beautiful job on the
military aircraft band, one of the original reasons I bought it. Triple
conversion, with essentially no intermod. It's a massive base station,
adaptable to mobile use (runs on 12VDC or 120VAC without
adapters) and no longer available new.

These are the two military aircraft scanners which I personally own.
They were both "best" by my specific criteria when I bought them,
but I don't know what's going to be best for you.

Also, the 20/20 has one button air & marine freq. search, and the 211 does not have air band at all.

There are photos of these two on my web page, if you have not seen them before.

Which big fat book of knowledge are you referring to? Cell phone use is prohibited under 14 CFR 121.306, which prohibits the use of electronic devices onboard commercial aircraft. The regulation also allows the operator to exempt certain types of devices for use either all the time (pacemakers, watches, calculators, etc.) or only above 10,000 feet (computers, etc.). Cell phones are not included on any of the lists of excepted devices, and are therefore prohibited at all times by the FARs.

My interpretation is that it is illegal to intentionally intercept telephone conversations, pager conversations, or scrambled or encrypted transmissions. This means that if your scanner picks up a Cell phone conversation then you must tell it to move on and keep scanning not listen to it.

2371. Re: Frequency Hopping Spread Spectrum Technology

Newsgroup: rec.radio.scanner
Date: 2000-08-03 00:00:00 UTC
From: David Steuber <nospam@david-steuber.com>
Message-ID: <m3vgxiuqwa.fsf@solo.david-steuber.com>
Source record: 83387

I've only followed this thread a little bit by reading it very quickly, so I may be a tad OT here.

I'm not sure exactly how spread spectrum technology is supposed to work, but it was my understanding that with the digital phones, the transmission was divided up among multiple frequencies in the band simultaneously.

Even if hopping is involved, if you know the range to scan, you can probably follow it if you are really interested.

I have been scanning the HAM bands with my PRO-94. I was very surprised to discover that there are people using 900Mhz phones that show up in the HAM band. One frequency in particular that I locked on to was 902.3Mhz. Someone had a phone, complete with call waiting. I had no difficulty listening to it. The conversation was crystal clear.

This just reinforces my feeling that if you want the convenience of a cordless phone, you need to get a digital spread spectrum phone. I have tested my phone against my scanner and found over a dozen seperate frequencies that it uses *at the same time*. The really interesting part is that while the phone was off hook, I could scan the spectrum it was using and see frequencies dropping off and on. The phone seemed to be dynamicly adjusting the frequencies in use.

The model of the phone, in case you are interested, is GE 2-920SST. So you can check up on my experiments by buying one and trying it out. The conversation with the clock was quite private as far as the scanner was concerned. I was able to correlate frequencies used by simply going off hook and on hook (by use of the talk button on the handset). Oddly enough, the manual's Limited Warranty section uses the corporate id of Thomson Consumer Electronics even though the phone is labeled as being made by General Electric.

Anyway, my phone is secure from the hobby scanners.

The person who I listened to on 902.3 had a phone that sat on that frequency. The individual made several calls all on that frequency. So, not all 900Mhz phones are created equal.

BTW, the calls were very dull and there is no chance of me repeating what I heard, so please don't ask.

Now the stuff I hear on the other HAM channels is much more interesting. There are talk nets by local clubs on the 144-148 band. Some of these people are mobile at the time. Very cool stuff that has

me interested in getting a HAM license so that I can join in on the
fun. Just listening seems less interesting than being able to
participate.

' No, It is illegal to sell or to listen. Not to have one.

I think it is illegal to buy, sell, or record. If you have an older scanner, or an illegal import (if US Customs could prove it), then it is perfectly legal to just listen. What you absolutely must not do is record or repeat what you have heard to anyone.

I see the law prohibiting receiving of cellular phone frequencies as being a rather silly law. If the parties wish privacy, they should use digital encryption. The people who do listen must keep everything they hear in confidence. I'm sure that there are unscrupulous people out there. I have no problem with the government prosecuting people who record and then sell or otherwise distribute phone conversations.

Even though I am now a scanner, and I do listen to phone conversations, I believe in personal privacy. However, privacy should be protected by the individual too. Personal responsibility is the price of liberty.

Rich:

Here are the IC-R2 specs, directly from Icom, and they indicate it is a triple conversion. Also, I've owned a few of these and found it to be very immune from interference.

Bill Crocker

Frequency Range (USA):
0.495-823.995 MHz
849.0-868.995 MHz
894.0-1300.995 MHz
Frequency Range (Canada, most other countries):
0.495-1300.995 MHz
Mode: FM, WFM AM
Tuning Steps: 5, 6.25, 9, 10, 12.5, 15, 20, 25, 30, 50, 100 kHz
Number of Memory Channels: 450 (400 regular, 50 scan edges)
Usable Temperature Range: -10°C to +50°C; +14°F to +122°F
Current Drain (at 3.0 V DC):
Rated Audio: 170 mA typ.
Standby: 100 mA typ.
Power Saved: 41 mA typ.
Power Supply Requirement: 2 x AA (R6) Ni-Cd or alkaline cells
Antenna Connector: SMA (50 ohms)
Dimensions: 58(W) x 86(H) x 27(D) mm, 2.3(W) x 3.4(H) x 1.1(D) in
(projections not included)
Weight: 170 kg; 6 oz.

Receiver
Receive System: Triple conversion superheterodyne
Intermediate Freq.
1st: 266.7 MHz
2nd: 19.65 MHz
3rd: 450 kHz
Sensitivity (except spurious points; typical):
FM (at 12 dB SINAD)
1.625 - 5.0 MHz, 0.4 µV
5.005 - 29.995 MHz, 0.25 µV
30 - 117.995 MHz, 0.2 µV
118 - 174.995 MHz, 0.18 µV
175 - 329.995 MHz, 0.22 µV
330 - 429.995 MHz, 0.25 µV
430 - 450 MHz, 0.22 µV
450.005 - 469.995 MHz, 0.25 µV
470 - 999.995 MHz, 0.28 µV

1000+ MHz, 0.45 µV
WFM (at 12 dB SINAD):
76 - 108 MHz, 0.71 µV
175 - 221.995 MHz, 0.71 µV
470 - 770 MHz, 1.0 µV
AM (at 12 dB SINAD):
0.495 - 5 MHz, 1.3 µV
5.005 - 30 MHz, 0.79 µV
118 - 136 MHz, 0.63 µV
222 - 246.995 MHz, 0.63 µV
247 - 329.995 MHz, 0.71 µV
Selectivity
AM, FM: More than 15 kHz/6 dB, Less than 30 kHz/60 dB
WFM: More than 150 kHz/8 dB
Audio Output Power: 100 mW typical, at 10% distortion with an 8 ohm load.
External Speaker Connector: 3-conductor 3.5(d) mm (1/8")/8 ohms

Cancer Suit Filed Against Telecoms

Filed at 4:46 p.m. ET

By Reuters
BALTIMORE (Reuters) - A Maryland neurologist filed an $800 million lawsuit against the world's No. 2 cellular phone maker Motorola Inc. as well as eight other telecommunications companies and organizations, claiming that his use of cell phones caused a malignant brain tumor.

Dr. Christopher Newman, 41, said in the lawsuit filed on Tuesday in Baltimore City Circuit Court that his years of using wireless handheld telephones led to his brain cancer.

Newman named Verizon Communications Bell Atlantic Corp., Bell Atlantic Mobile Inc., Southwestern Bell Mobile Systems Inc., Washington/Baltimore Cellular Ltd., SBC Communications Inc. (SBC.N), the Cellular Telecommunication Industry Association, and the Telecommunication Industry Association in the lawsuit.

Newman claimed compensatory damages in excess of $100 million and punitive damages in excess of $700 million.

The IC-R2 is triple conversion and employs IFs of 266.7, 19.95, and 0.45
MHz.
It's an amazing little radio.

I regularly fly from Belfast to London (and often on from there). I always ask permission to use a frequency counter and/or scanner, and have never been refused. Most pilots state that it's OK provided the seatbelt sign is not lit, some say that I can listen without restrictions (albeit not many).

This morning the Captain of my flight to London said that I could listen 'but if the plane turns upside down, would I mind turning my scanner off, please. If it's not too much trouble'. Haven't the Brits got a wonderful sense of humor ;-)

The freq counter works reasonably well, provided you get a window seat. An aisle or a middle row seat is totally dead.

I did get into some 'bother' last year on a flight from Canada. The stewardess was convinced that my freq counter was a transmitter, threatened to have me arrested on arrival at London. I told her to go ahead and tell the Captain. He came out and we had a chat about airband radio and flying for 20 mins, he then brought me into the cabin, switched off the autopilot and let me pilot the plane for 10 mins. Not many people can claim flying a 767 as part of their PPL!!

The bottom line is to keep yourself right: always ask the Captain's permission.

Steve.

Does anyone know what the frequency coverage of either one of these radio's is?

Bearcat BC-20/20
Bearcat BC-211

And yes I mean BC-211 not 210, I did not even know there was a Bearcat BC-211 til the other day. Any other info you can offer on either one of these radio's would really be appreciated.

Source record: 83436

Yup...that's exactly what I've seen so far with my 92A. I haven't seen any of the "ID flicker" problem reported on the earlier 92's, but my 92A seems to fail to detect the ID a bit too often. In closed mode, this means that the scanner misses a fair amount of traffic. Side by side, my BC-245 has none of these problems. I'm not overly upset, though, since I really bought the 92A to fill a need as a conventional rig with CTCSS/DCS, alphatags, and 50 channel banks. It does all that quite well, so I'm a reasonably satisfied customer, especially since I got mine at the July sale price. I'd be a lot more bugged if I'd paid a hundred bucks more.

I think this is false. The early Panasonic Gigaphones were
spread spectrum and used analog (not digital) voice
transmission. (Don't know about the later ones.) I think there
are many 900 Mhz spread spectrum phones that also use analog
transmissions, but I couldn't tell you which ones. The fact that
it may have "DSS" labeled on the phone somewhere is no guarantee
that the phone uses digital transmission.

2386. Speech Inversion descrambling!

Newsgroup: rec.radio.scanner
Date: 2000-08-03 00:00:00 UTC
From: ctpds49@aol.com
Message-ID: <20000802220226.21599.00000370@ng-cd1.aol.com>
Source record: 83440

Speech Inversion is accomplished by mixing the speech spectrum (typically 300-3000 Hz) with a tone (commonly 3500 Hz) to produce some audio frequencies (3800-6500 Hz) then filtering to 3200-500 Hz constituting the speech inversion.

2391. Pro-92A Problems and Observations

Newsgroup: rec.radio.scanner
Date: 2000-08-03 00:00:00 UTC
From: andyman@noneofyourbeeswax.com
Message-ID: <3988b704.5875210@netnews.voicenet.com>
Source record: 83445

This problem I am having with my Pro-92A (20-522A 05A00) seems to be random and somewhat infrequent. Sometimes when I receive a MO type II trunked transmission while in open mode no ID shows up, until I hit manual then an ID will be diplayed after a short ID wobble. When no ID shows up it will not let you hold on that conversation or store the ID, and these are valid talk goup transmissions that for the majority of time I receive fine with the proper ID displayed while in the open mode. In the closed mode with the ID's I programmed in, the scanner appears to be working properly (no ID wobble as in the old 92). Compared to my BC-895, the 92A picks up just about every trunk transmission the 895 does (at least 95 percent). The 92A has pretty much static when monitoring a MO type II system, while the my 895 has none. Conventional transmissions are clear on the 92A. The constant hiss and pulse (from the speaker amp?) when the radio is squelched is still present from the old 92 and has not been fixed for the 92A. The hiss is very low in volume but can be annoying in a completly quiet room. I am very tempted to return the scanner and just wait it out for something better to show up in a year or two. Anyone else have these problems?

Andy

It's illegal, at least in the US, for a scanner to be able to pick up
freqs in the cellular (800 MHz) band, or for one to modify a scanner to
be able to do so.

I wish I still had the references, but they are lost in the mists of time (anything more than a year ago :<)). It concerned several instances where non-certified electronic equipment being used by a passenger on board a trans-atlantic flight may have interferred with the flight deck instruments, navigation and communication. In at least one incident, such interference was alleged to have been a key factor in the loss of the aircraft, crew and passengers. These incidents occured in the 60's or early 70's as I recall, and advances in flight avionics have rendered them less susceptable to interference, which is why some airlines are more willing to allow the onboard use of passenger equipment. This may have been in an article in Monitoring Times magazine. I do know that, when I was traveling back and forth to Europe in the 70's, TWA, Pan Am, and BOAC (now BA) would not allow the inflight use of any electrical/electronic devices brought onboard by a passenger. A stewardess on a TWA flight to London wouldn't even give me permission to use my cordless Norelco shaver, instead supplying a special corded unit that would plug into the aircraft's electrical system (this was a 707).

As to why inflight use of a transmitter of ANY kind is prohibited, consider that the onboard avionics which are heavily tested and certified to be non-interfering are located inside the metal shell of the plane, which protects the equipment from interference from the OUTSIDE. If the non-certified equipment is located INSIDE the aircraft, the primary line of defense (the fuselage) has been bypassed. Think your equipment can't affect other radios or instruments? I use to have a BC-100XLT that, if I turned it on within 10 feet of somebody using a cordless phone, the phone would hang up. These rules were in place long before airlines started installing inflight phones.

Like the man said, ALWAYS ask the Captain of the plane. FAA regs give him the final say.

Lloyd, I have a serious question for you. If you're really a prophet of God, why advertise it in your username? A true man of God can stand on his own, and people will recognize it and flock to him. It is only the false ones who have to push themselves on people one way or another.

Jesus did nothing to advertise his "status." His mere Presence was enough... people KNEW they were in the presence of Holiness just by his Presence. Why do you feel you have to jump up and down and scream about who you believe you are?

Why don't you give that a little thought, tone down your posts, post under the name "Lloyd" instead of "Prophet Lloyd Davies," and rejoin the human race? People might even like you if they knew what you were really like underneath all that huffing and puffing, who knows?

Anyway, if I ever met you at a hamfest, I would be happy to have a cup of coffee with you.

Take Care,

W.

Look past the ego, and you will see,
what dwells within is God, not "me."

2400. BC200XLT not receiving 150 MHz Band

Newsgroup: rec.radio.scanner
Date: 2000-08-04 00:00:00 UTC
From: Mike Gormley <WA8VEC@ARRL.net>
Message-ID: <398A963E.D1B9D4D5@ARRL.net>
Source record: 83154

My battery died so I ordered another one and charged it up. Now the radio displays the freq's for the 150 Mhz band but no reception. I tried to reenter the freq's but that did not help. It does receive 400 mhz band freq's .

Do I have a junk radio now?

I have purchased several of these, and a fair price is $275.00. This
seems
to be the going rate for one.

Corkinator,

If we all got what we deserved, we would be dead, because "the wages of sin is death, but the gift of God is eternal life, through Christ Jesus our Lord". - Romans 6:23. And I consider myself very fortunate to be loved by God.Because I know that God loves me, I don't need to be insecure and put other people down to make myself feel good. It's a shame that the world is filled with unloving trash like you and all the others who put people down. Maybe someday you'll grow up and realize that you're no better than anyone else, that we are all created equal under God's eyes. Until then, I'll pray for you. God Bless.

Adam Kolari

P.S. - You'll probably come back with some immature flame, but that's OK, I'm expecting it.

Mike:

I can't recall if the BC200 has a CPU reset button somewhere on it? If so, have you tried that? Usually it's a very small hole that you carefully insert a paperclip wire, or similar device, and push on a tiny button. Sometimes they're in the battery compartment. Be advised, doing so will wipe out all your programming.

Bill Crocker

Given the ignorance and stupidity of the average joe these days,
look at the judgment against SearsRobuck for the fool who picked up his
loawnmower to trim the hedges, or the clown who put modern 44cal amunition
in a very old pistol and collected big time when it blew his hand off, I would
venture a guess that anyone who every stood near a cell phone [even if it was
off] and developes a brain tumour, will collecty big time from some jury here
in the USA.
OF course this ignores the study done in England where a MD researcher showed
that using a cell phone heated the brain enough to improve the circulation
in the area exposed to even that small amount of RF.

Just how absurd can it really be? Motorola has placed warning labels
about close proximity RF for years. My 4 watt HT has a warning in the
owners manual. The TV and FM towers we visit have warnings about RF.

O.K. lot more power at those sites. But it is just a plain scientific
fact.....
It's called radiation. Radiation affects the tissue when there is
long-term exposure.

Now just how much exposure?
I sure don't know.
But common sense tells me that since the cellphone gets warm while
transmitting, that the energy just does not go into the air.
Consider it an acceptable risk of doing business in today's world.

On the plus side...maybe the CTIA will be too busy to bother with us for
a while.

You are assuming that this is everyone's religion. How nice of
you to preach on the NG and to call the great Corkinator "trash"
Which church did you learn how to call people trash?
If you had any brains at all you'd know that Corky Mackey was
the only trash around here.
Pray for yourself so that you don't call Corkinator "trash" any
longer.

I answered that already Corky-John. Why bother Jon? What difference would it have made? You still are a repeater jamming and burning up fool. Telling the owner would do nothing, but I will mention it to him if that makes you feel better Corky-John. Still doesn't change what you did and what 4 hams heard you do. Lie on little boy.

Anyone who memorizes the test material van become a VE. You are proof John-Corky. BAWAHAHAHAHHAHA. That is all you have to offer up as an example of your sucess. VE and OO. BAWAHAHAHAHHAHAHAHA! You left out traveling nurses aide John-Corky. Why do you always try and hide that part of your life. Ashamed? Still trying to hide those molestation of the elderly charges? Why do you hide this aspect of your life Corkey-John?

>YOU are just jealous of my status & responsibility!

What status and responsibility is that Corky-John? Your status as the most offttopic poster (389 a month average) on this NG? Your responsibility for stalking many? No, you have done and possese nothing that I nor any person could desire. You are a freak.

> Glenn Hansen, KB7PKC, you are just a LIAR trying to cause problems.
> (Do I need to re-post that message you put on rec.radio.swap 4 years ago

Ahh, Corky-John threatening me with a forged message his buddy Petey posted 4 years ago. Go ahead John, go for it. It will only demonstrate for the

newer users what a loser you continue to be. Desperate action by a desperate Corky-John Mackey.

How many repeaters have you smoked today Corky? How many repeaters have you claimed to own that aren't your today John-Corky Mackey?

Why would you want to use a cell phone on a plane anyway?! Can you imagine the roaming charges! :)

I've brought scanner and 2m HT's on board airplanes before, keyed the HT's and listened to the scanners... I'm still here. :)

>I disagree. As already posted by somebody else, it is illegal to sell
>scanners capable of picking them up (producing them too) and it's also
>illegal to listen to them, but what's done is done

After a certian date a few years ago (don't remember the actual date), the manufacture, monitoring or modification of a scanner to pick up cellular phone calls is illegal (it's also illegal to listen to cordless phone calls under the same law). I have a scanner that was made prior to the ban, so it could monitor cell phones if I wanted to, but it's illegal to listen... it's not illegal to possess it (unless your state has anti-scanner laws) as long as it was made before the ban... actually, I modified my scanner and it picks up somewhere from 800 - 940 without any pauses... (forget the exact range). Unfortunately the scanner is busted - the keypad and display don't work - $184 worth of repairs according to Radio Shack! :(

I believe both these radios can be programmed via computer, but the trick will be to figure out how. The link http://www.interplaza.com/bensware/rm.htm has info on building the interface and demo software. I have also tried to work with Radio Shack with no success.

>are these called I.D'S? and what do i do with them if anything?

Well if you have a trunk tracker scanner capable of receiving the
trunked system then you need to program in the frequencies, the Trunk System
type (Motorola I,II, Ericsson, LTR) and then you input the trunked ID's
in the trunked banks.
If you don't have a trunked capable scanner you can get a BC-245, Pro-94 or
other scanning capable of decoding a trunked system.

My, my! A little touchy are we, Corky-John? The record is there for
all who care to research it. The times you accused the late Mr. Cheek and/or
his family of deceiving the hobby public about his condition and suggesting
that attempts by others to secure donations to defray his last expenses of
illness and passing were a scam. It is all there, Corky-John, and those
corrupt and spiteful little slurs and your outright lies damn your FOREVER as
a detestable individual, worthy of the utter contempt of the entire hobby.
Enjoy your hard won notoriety, you worthless bit of excrement! Aren't you glad
you invested so much effort in securing your place in radio hobby history?

I had no idea the Shack had them.

There is one real nice plan on the net that shows the whole layout on a perf board, literally made for a beginner. Like Bud said, cheap and easy...or was Bud talking about himself? :-) No, he meant the slicer.

BTW, Texas Two sells one for $75 http://www.texas2way.com/
OPto sells the Opto link for $130
http://www.optoelectronics.com/optolinx.htm

Big bucks for a hand full of parts! The opto also has a built in CIV/radio interface also.

After consulting the StronSignals website. Please goto RECIEVER RELEASE DATES, click on PRO-2067, and the COMPLETE specs are there. Your question is answered:
Scan Speed: 25 channels/second
Search: 50 steps/second

There you go, courtesy of Stronsignals.net!

Robert,

Do you think that your luck will change if you inform everyone to compete
against you???

Either you are posting commercial Spam or you are a moron!

Hi everyone,

I picked up a set of Lenmar rechargeable alkaline-manganese batteries today.

Supposedly these batteries can only be charged with Lenmar's special recharger, but I think it's a bunch of bunk. I have a charger capable of either NiMH or NiCAD batteries. Does anyone know which would be the best setting for these? I believe NiMH charges for longer.

Thanks for any info, and if you get the chance please CC: your response to core@zipcon.net.

Thanks Much

Joe,
Maybe he's just a nice guy who thought he'd pass on to everybody else the news of a chance to get a free scanner. As strange as that may seem to you, there are nice people out there. After all, even though he might be reducing his odds of winning, he's not losing anything, he doesn't expect to win anyway, and it's nice to share. Not everyone is "Gimme-Gimme! It's Mine!!".

' >
' Just how absurd can it really be? Motorola has placed warning labels
' about close proximity RF for years. My 4 watt HT has a warning in the
' owners manual. The TV and FM towers we visit have warnings about RF.
'
' O.K. lot more power at those sites. But it is just a plain scientific
' fact........
' It's called radiation. Radiation affects the tissue when there is
' long-term exposure.
```

Radiation falls into several categories. We are talking about EMF radiation. That falls into two categories: ionizing and nonionizing. Ionizing radiation is UV (above the visible spectrum) and up, including x-rays and gamma-rays.

Cellular frequences fall bellow the so called microwave band. That band is solidly in the non-ionizing category. As non-ionizing radiation, it is fundementaly incapable of knocking electrons off of atoms or molecules, which is necessary to effect chemical changes.

So while x-rays can damage chromosomes, causing cancer, microwaves and radio waves can't. Not even when they are powerful enough to cook you or your dinner. That cooking is the result of thermal energy.

For a cell phone to cook your brain, it would have to output sufficient energy to raise at least a portion of the brain up to cooking temperature. Conduction by blood flow will prevent that.

It just can't happen.

Meanwhile, brain tumors are a risk of living. There would have to be a study that demonstrates a statistically increase in the probability of getting cancer. There are a lot of environmental variables out there, so such a study would be rather costly just to design and to establish a proper baseline.

If the doctor really has a problem, he should send off an e-mail to God@heaven.gov.

None@dontevntry.oro (Who Did you Expect?) writes:

' OF course this ignores the study done in England where a MD researcher showed
' that using a cell phone heated the brain enough to improve the circulation
' in the area exposed to even that small amount of RF.

I missed that one. Perhaps the brain is a bit of an insulator,
because the head radiates heat at much more than .6watt.

I just bought a Pro-2067 today and although I don't use it in truck mode, I do use it in PL. I find that in open mode, it will switch between two conversations with two different PLs if they going simultaneously. However, if you're running in PL, why use it in open mode? I really like the rig, it's very nice.

> before I bought mine.... I just don't understand that.

Never mind, I bought one today. I found the spec I was looking for (scan speed: 25 channels per second.) I am only using it in PL mode since they're nothing trucked that I'm interested in listening to but it is fine rig indeed. Like it a lot. My only complaint is that the sensitivity could be a little better.

Hi All,

The Giant Page O'Shortwave Links (covering all areas of radio
with a focus on shortwave) was updated today with new links.
Sorry for the delay, it has been awhile. Also, a new feature
has been added - Seattle Area Scanner Frequencies, and the page
has been added to a shortwave webring. More special features
are planned soon to make this MUCH MORE than just a link page.
When I get the time there will be some MAJOR additions, making
this one of the more unique shortwave pages on the Web!

To check out this page, please go here:

http://swlinks.webalias.com

AOL Users: <A HREF="http://swlinks.webalias.com">click here!</A>

Thanks for visiting.

Look past the ego, and you will see,
what dwells within is God, not "me."

Me too. I think it was the AR900. What a POS! Bought it cause it got cell
(back when I was a newbie and HAD TO HEAR CELL PHONES.)
Now it sits in a drawer in my living room. Difficult to operate,
s..l..o...w....s....c....a.....n.......n.......i.....n.......g.....
speed, and
if you lock out some channels, it doesn't skip them, it still goes through
them all, it just doesn't lock onto a signal from them. Volume and squelch
knobs are very delicate, very surprised they haven't broken off . Oh yea,
the manual sucked.
I did like the on/off switch for the backlight and the belt clip.

2493. New Encryption Method on 165.790MHz (LAX , CA area)???

Newsgroup: rec.radio.scanner
Date: 2000-08-04 00:00:00 UTC
From: kc6ijm@arrl.net
Message-ID: <MPG.13f49b4ebe81a9999896bb@news.northgrum.com>
Source record: 83291

Curious if anyone knows what type of encryption is being used on 165.790MHz in the LAX (CA) area. The base transmits almost always in the clear, with most replies from remote units encrypted. Transmissions are through a repeater. The transmission sounds very different than
the typical DES or DVP style "white noise" with the trailing edge sequencing tone. It sounds
like DES with a warble with no trailing tone. I assume that this is some federal agency, but
am just curious on the encryption type (no purpose - just curious!).

2494. Re: Fat Mackey jealous of Love for Cheek

Source record: 83292

Never said I was religious, or perfect, and I know that I'm not perfect. I probably should've conducted myself differently, but it ticks me off when people think that they are better than someone. I shouldn't have used words like prick, or arrogant, or (**gasp**) trash. How come you aren't scolding people (or at least bringing it to their attention) when they use words like f**k, sh*t, bas**rd? It seems like people will go out of their way to find fault in Christians. I could go on and on, but it's such a beautiful night here in northern Ontario, Canada, that I don't want to waste my time defending myself from little children who are all fart and no crap (IOW - all talk, no action). Cya you all tomorrow! God Bless.

No default here Toilet Boy. The proof of your lies has been many many times before and also resides in DejaNews. You can keep trying your coy little game and pretending the truth about you isn't known, but it's simple futility for you.

Since you have such a short memory (an established indicator of limited intelligence) here is the list to remind you of your lies:

1. I proved you lied about the first date of your appearance on the Internet.

2. I proved you lied when you denied making the claim about patronizing under age child prostitutes.

3. I proved you lied when you claimed to have written "several technical articles" for the ARRL and other technical publications.

4. I proved you lied when you claimed to have adopted your dead sister's children.

5. I proved you lied when in the span of two weeks you claim to be married in one forum and single in another.

6. I proved you lied about having college degrees.

7. I proved you lied when you denied you were identified as a known Internet abuser by Joe Greco on his published lists of spammers and idiots.

8. I proved you lied when you claimed you weren't stealing Internet access and your employer terminated you for theft of services.

9. I proved you lied you claimed you've never used fictitious or illegal Internet address.

10. I proved you lied when you claimed you were not the most prolific poster of off topic messages.

11. I proved you lied when you said WD-40 was unsuitable for electronic use by posting another endorsement from Roy Lewallen, w7el@teleport.com, which you ignored.

12. I proved you lied about your place of employment when I posted your work telephone and related data. I also proved that *you* worked at that office and not your retired father.

13. I proved you lied when you claimed that Bill Cheek had never been a member of Mensa.

14. It's been proved by others that you lied when you claimed to have never lost an ISP for your forged cancels.

15. It's been proven by others that you lied when you denied using numerous fake identities on the Internet.

16. It's been proven by others that you lied when you denied you've never blown up a repeater system through your incompetence and total lack of technical expertise.

17. It's been proven by others that you lied when you denied trying to break into other computer systems using Back Orifice.

18. It's been proven by others that you lied when you claimed you had "acquired MORE FCC licenses ... than could be counted on one hand!"

19. It's been proven by others that you lied when you claimed you have made your "lioving from the Radio Communicatoins Field for most of the last15 years."

20. It's been proven by others that you lied when you denied having stalked Bill Cheek for over three years.

21. It's been proven by others that you lied when you denied being kicked off Fidonet by Bill Cheek.

22. It's been proven by others that you lied when you claimed Bill Cheek had been kicked off of Fidonet.

23. It's been proven by others that you lied when you claimed a police had been filed supposedly about harassing phone calls made to you at your place of work.

24. It's been proven by others that you've emailed death threats to your detractors on the Internet.

25. It's been proved by others that you lied when you claimed to "have helped resolve" the problems of the scanner newsgroups and have "rid this NG of trouble makers."

26. It's been proven by others that you lied when you denied
sending bogus complaints using aliases to the Internet providers
of your detractors.

> > Reposting one of your diatribes from one of your fictitious
> > personas blasting Cheek doesn't count.
>
> First - I have NEVER had a fictitious persona.

You have been proven to have many other identities. A couple of years
ago, I posted a list of over a dozen aliases that you have used.
For instance, remember traveler?

> Second - I could post messages from many others like Glenn Q.,
> Hugh Duff, Flatted5th,

Unlike you Toilet Boy, at least Glen Quarnstorm is consistent and
honest. He doesn't like you, Cheek, or me, so he cancels out. Hugh
Duff is so wacked out on prozac, he's oblivious and clueless to what
is really happening so he cancels out. Flatted5th is a pseudonym
so he cancels out.

> do you want me to go on?

You have no one left to make your support Toilet Boy, so yes
do rant on and on and on and on and on and on ...

ROTFLMAO! Toilet Boy, do you actually think that by cross posting your lies and diatribes to rec.radio.amateur.misc you are going to embarrass me? There is no shame in showing the world that you are a liar and a fraud. Remember the list of your lies? Here is a reminder:

1. I proved you lied about the first date of your appearance on the Internet.

2. I proved you lied when you denied making the claim about patronizing under age child prostitutes.

3. I proved you lied when you claimed to have written "several technical articles" for the ARRL and other technical publications.

4. I proved you lied when you claimed to have adopted your dead sister's children.

5. I proved you lied when in the span of two weeks you claim to be married in one forum and single in another.

6. I proved you lied about having college degrees.

7. I proved you lied when you denied you were identified as a known Internet abuser by Joe Greco on his published lists of spammers and idiots.

I have both a pro 91 and a pro 94. I have noticed that the receive sensitivity level in the pro 94, seems to be in my opinion not as good as in the pro 91. In the trunking mode for the most part, and i am using the sam antenna when i have noticed this, and have been in the same spot, (location). Signals that have little multipath detection on the 91, have more in the 94, in my opinion. Seems a little odd maybe that they would try and atenuate the receiver of a later modell scanner?? Maybe i'm wrong?

Anyone noticed any degridation as well. hmmmmmm?

I have the opportunity to obtain a Pro 2006 scanner, from a friend who received it (ALMOST NEW) when a relative passed away a few years ago.

It has the box , packaging, all the documents, and looks like it was never even used.

What I am trying to find out is what is a fair price to offer for it. I don't want to rip this guy off, but I don't want to pay a couple of hundred for a $50 item.

Any suggestions would be appreciated.

Frank:

First you should check the display back lighting. Early versions had a dimmer switch on the front, later versions had an On/Off switch for the display back light. In any event, the light was known to fade, and eventually fail after awhile. It is repairable however.

If it's in perfect condition, and the back light is bright, a fair price would be around $200~$250, however, on Ebay, they have been seen to go as high as $350+...but that doesn't mean it's a fair price.

> transmission was divided up among multiple frequencies in the band
> simultaneously.

What you are referring to is called direct sequence spread spectrum. Direct sequence spread spectrum systems are so called because they combine a series of binary codes (pseudo-random code), along with the basic carrier signal (ie. voice), to produce a spread spectrum signal.
The code sequence is used *directly* to modulate the carrier, thereby setting the block of frequencies and the RF bandwidth, ie. the signal is spread over a block of several frequencies as set by a the pseudo random code. The signal that is transmitted in the air may be either analog or digital. However, the code used to modulate and demodulate the basic carrier is digital (ie. binary code).

Frequency hopping spread spectrum is another matter. it "hops" from frequency to frequency over a wide band. Most hopping systems use uniform frequency hopping over a band of frequencies. A frequency hopped system can use analog or digital carrier modulation and can be designed using conventional narrow band radio techniques. Again, the basic carrier signal (ie. voice) itself may be analog or digital. If it is analog and narrow band techniques are used, it would seem that a sufficiently fast and sensitive scanner should be able to pick it up (if one exists).

Another possible scenario is that cell phones represent too much competition
with on-board telephone systems; and the airlines simply cannot have that.

> excepted devices, and are therefore prohibited at all times by the FARs.

Mark, the big fat book of knowledge I was referring to was 14 CFR 121.306
and the "counterpart" found under 14 CFR 91.21. Since the original post
made it clear the poster was not referencing Part 121 flights only, 14 CFR
91 stuff was fair game.

The way Part 91 is written, I can operate a cell phone under VFR period,
or, if operating IFR, I'll be fine if I have "determined" (whatever that
means) it won't cause harm to the nav/com system. Likewise, under Part
121, if you determine that a cell phone is safe to use in flight, it can
be used.

AFAIK, the bottom line is that the FAA can't unilaterally bust somebody
for cell phone usage unless they've double checked with that operator in
regards to "approved" electronic devices on that aircraft. I know I'm
stretching it slightly with the Part 121 references, but I'm sure the FAA
can't bust me on a Part 91 flight.

I get this too, especially with Ni-Cads. I'm guessing the indicator is
calibrated for 1.5 volt dry cells, not 1.2 volt Ni-Cads (?)

Anyone know for sure?

2527. Using all mode receivers to surf subcarriers on FM radio stations

Newsgroup: rec.radio.scanner
Date: 2000-08-05 00:00:00 UTC
From: Robert Casey <wa2ise@ix.netcom.com>
Message-ID: <398CA535.B75B8A2A@ix.netcom.com>
Source record: 83048
Cross-posted to: rec.radio.shortwave,rec.radio.scanner,rec.radio.amateur.equipment

Listening to subcarriers on FM broadcast stations with the TS440S and similar radios:

As the TS440S can receive signals all the way down to 30KHz all modes (AM, FM, USB, LSB, CW), you can "surf" the SCA subcarriers on the FM broadcast band. Also those of TV stations on their sound broadcasts.

What you need to do is tap the output of the main FM carrier detector before the deemphasis circuit in an FM broadcast band radio. A cheapie clock radio will do at first. The deemphasis circuit is usually an RC low pass
filter. One way to "hunt" for this point is to hook up an audio amplifier to a
test probe, and find a node on the circuit board that has main channel broadcast audio with lots of treble as compared to that found at the top of the
volume control. One this spot has been identified, connect a 0.01uF cap in
series with a 1K resistor, and that then in turn feeds the center conductor of
a length of thin coax. The coax ground connects to the radio ground. The

other end of the coax connects to the TS440S antenna input. Check that the
FM broadcast radio still plays, as the coax cable is now loaded with 50 ohms
impedance.

Disconnect the mic on the TS440S so you don't accidently transmit into the
FM radio! Tune in 38KHz in USB mode. Now tune around on the FM broadcast radio. You should be able to hear the "difference" (L-R) audio

signal of FM stereo stations. You should be able to notice the usual lack of
vocals in most songs, as compared to the FM broadcast radio's mono speaker output. Assuming success, try tuning in 67KHz FM mode on the TS440S. Now tune around on the FM broadcast radio. You may find various foreign language programs and data transmissions. Also try 92KHz FM on the TS440S. Expect about 10% of FM broadcast stations to have subcarriers. Don't overlook the college radio subband from 88 to 92 MHz.

You're essentially "surfing" the radio specturm in two dimensions, one "axis" is the FM broadcast band, and the other is each FM station's subcarrier signal spectrum.

2528. VOTE NADER, he's our only Hope!

Newsgroup: rec.radio.scanner

6 Aug 2000 00:00:08 GMT

It's hard for me to believe that the next president of the United States will be George W. Bush or Al Gore. Both remind me of Hollywood movies that have been focus-grouped to death: they push all the appropriate buttons, but have zero original vision. Both stand for the same thing: corporate-driven business as usual.

There must be some way outta here.

Ralph Nader is no joker or thief. I think he and the Greens could give Al & George a good run for their money. At 65, Nader isn't running as fast as he used to, and the Green Party doesn't exactly have its platform figured out, but I think they have what it takes to inject a dose of radical democracy into the race. Unlike the two Tweedles, Nader is real, he stands for decency and common sense and he still commands a lot of respect in progressive and activist circles. And hidden behind the rainbow coalition of lefties, eco-feminists and crazies, the Green Party does have some great ideas. It's the only party that stands for the Tobin Tax, true cost markets, media reform and putting corporations in their place.

In October, with a fired-up Nader hurling intelligent sound bites into the presidential debates, the whole game show might actually be worth watching. The alternative is the most sophomoric presidential race in American history . . . and the lowest voter turnout ever.

I'm putting a GO GREEN - VOTE NADER graphic at the end of all my emails from now on. I'm betting that, between now and November, the American people will wake up to the fact that their sacred democratic experiment has now degenerated into a choice between a corporate-sponsored Republican and a corporate-sponsored Democrat.

In these heady post-WTO days, a sudden, massive protest vote against Al & George is entirely possible and Nader would be the most apparent heir. With perhaps less than 25 percent of the people voting, an inspired Nader campaign could grab a surprising share of the action. And even if he does not come close to winning, at least imagine how his campaign might pull together some of the fired-up, post-WTO forces and lay the groundwork for something really visionary in 2004.

Download the graphics and help launch an email pyramid scheme to dump the Tweedles! Two formats are available, a magazine

sticker (17K) or a Banner ad (5K):

==========

What it Means to be Green

"At the root of all Green political action is nonviolence, starting with how we live our lives, taking small, unilateral steps toward peace in everything we do. Green politics requires us to be both tender and subversive. Affirming tenderness as a political value is already subversive. In Green politics, we practice tenderness in relations with others; in caring for ideas, art, language, and culture; and in cherishing and protecting the Earth. To think Green is to build solidarity with those working for social justice and human rights everywhere, not bound by ideologies."

-Petra Kelly

Incorrect. They prohibit them because a cell phone that high in the sky will transmit to every cell site in the country and interfere with the cellular system, NOT the airplane. The pilots themselves use radio to talk to the control towers! That doesn't interfere with navigation systems either. Why not ban those too?

Thank you! This sounds pretty simple. Now, I just need to find some
frequencies to listen to. Is there any way to scan through everything,
searching for in-use frequencies, or do you have to program specific
ones in?

I'm in a northwest suburb of Chicago, near Pauwaukee airport. The Wheeling
and Buffalo Grove police, fire, etc should be in range, maybe a few other
'burbs. I don't know what else this kind of scanner could potentially
pick up. Any ideas?

I'm confused. God was created in man's image? Don't you mean man was created
in God's image. What's his name and where does he live, God not man.
Please send all info to KC3AU for further investigation.

The point that is missing from other posts is that it is typically higher
end scanners offer the extended coverage you are looking for, Bill. Keep
an eye out on ebay (heaven forbid!) or the RING! Trading Station for some
used rigs such as those mentioned.

There isn't much that can be done to this scanner, it's a pretty good
unit as is and you would be better off leaving it stock.
If just gotta listen to cell phones get an old pro-37 and have at it,
you'll get bored with it after about 30 minutes.

Thanks Bill, that's what I assumed too, but their website doesn't show anything like the 2066, and I can't find a Uniden/Bearcat model number on the 2066 itself.

I know RS is just a reseller and doesn't make their own scanners - anyone have an idea?

Your right, Jesus would never kick anyone's butt. Like I said, I am not perfect. I have a bad temper, but it is getting better. I have to learn to look at my WWJD bracelet more often. And to say whether or not I'm religious, I don't know. It depends on how you define religious. Religious is a pretty strong term. I prefer to say that I'm a Christ One (one who follows Christ), or Christian (means the same as "Christ One") if you will. I just try to live my life like Jesus Christ did when he was on earth. I don't take any offense to your comments, it's just that I thought you were just another Christian-basher. God Bless and Happy Scanning!

>speed within about five seconds of the loss of those two engines.
>Nothing for the pilot to do but watch the ground come up to meet him.

Several points. It turns out this accident has at 4 least precursors
that are documented in a letter from the NTSB to the DGAC/FBEA on 9
November 1981. AT least one of them of them did in No. 2 engine, put
holes in 3 fuel tanks, and severed numerous hydraulic and electrical
lines, as well putting a large hole in the skin covering the wheel
well....

One of the agreements with the DGAC/FBEA/AF was in the event of tire
failure (real or suspected), the operations manual was modified to
cleardly madate that the landing gear NOT be retracted and the
aircraft is to immediately return to the airport. An attempt was made
to retract the gear, and that may well be what took out the second
engine. It is interesting that the NTSB letters said the 'consequences
(includinding hydraulic failure, fire or explosion) of such action
(retracting the gear) could be catastrophic...'

It is doubtful the aircraft even reached stall. According to the
aircraft data, the minimum control speed on 2 engines is just OVER
300mph (260kt) , and the drag from the high alpha operation required
at high MGTOW means that the total thrust with afterburners and
emergency short term ratings on the engines is such that the drag
exceeds thrust up to about 285mph. Most aircraft have the lowest drag
at speeds somewhere near V2. For concorde, lowest drag is at roughly
470mph (400kt) at MGTOW, and 365mph (310kt) at landing weight.

Your wrong. Jesus did forcefully drive people out of the
temple. You could say that he even kicked their butt.
Study your bible harder if you're going to use it in your
arguments.

I can't help you with the codes but wanted to thank you for the link. Brought back may fond memories when I was a member of Hopelawn VFD District 8 in Woodbridge in my late teens early twenties.

South Amboy was my old stomping ground, can vividly recall endless hours crusing South Amboy in the early 80's hanging out with many friends that were members of the SAVFD and FAS.

I heard some years ago that my best friend at the time, Drew Newcomb had made Chief, way to go Drew! ..

Enought off-topic banter, simply thanks for the link!

Have a Pro 2035 for sale. Comes with manual, original box, and AC adapter. Good condition. Continuous from 25-520, 970-1300 MHz. $225.00 shipped. Money order preferred.

Sent via Deja.com http://www.deja.com/
Before you buy.

2565. RS power supply

Newsgroup: rec.radio.scanner
Date: 2000-08-05 00:00:00 UTC
From: jh-lewis <jh-lewis>
Message-ID: <5mZi5.26$PJ.40234@nnrp2.sbc.net>
Source record: 83127

I'm looking to pick up a good power supply (probably from RS) that does not hum...for some reason, my new Pro 2066 hums when I attempt to use any of my current power supplies (they work fine with other radios, just not this 2066)...

I believe part of the reason may be that the 2066 is a mobile radio, meant to obtain it's ground connections from the vehicle itself - and running it off the wall adapter doesn't satisfy this need - hence the hum... Sound right?

Any suggestions?

"radiosigs@mindspring.com" <radiosigs@mindspring.com> writes:

' I'm confused. God was created in man's image? Don't you mean man was created
' in God's image. What's his name and where does he live, God not man.

You can get all the info you need at http://www.heaven.gov/. Or, you
can send an e-mail to God@heaven.gov. He usually doesn't reply
directly.

You can receive His broadcast on 999Ghz. Do not confuse this with the
broadcast on 666Ghz. That is the broadcast of the opposition. You
need to be using a scanner that works with polarity modulation. Be
sure to use the correct alignment. Your filter neads to line up so
that the horizontal polarity is in line with your latitude.
Horizontal polarity represents 0, vertical polarity represents 1. You
need to use the Aramaic character set code page. All transmissions
are in Aramaic with no compression used. You may point your antenna
in any direction. The broadcast is a non-localized phenomenon.

Oh yes, there are 3 null characters transmited every 314 characters
for synchronization. The character stream basicly goes 3 nulls
followed by 297 characters of information and then 14 characters of
error detection / error correction code.

You can get full specifications on the signal encoding from:

http://www.heaven.gov/word/broadcast.html

If for some reason you can not access the site, it means you are a
non-believer and will suffer eternal damnation after the rest of your
life.

Hi,

Maybe you can put light in the darkness !

Some people say the Bearcat 760XLT covers the 30Mhz band, but others swear
to tell it starts only at 66 !!
Are there 2 different types of the Bearcat 760XLT or is there a difference
in USA and Europe ?

Hope you got the right answer !

Thanx for reading,

Greetings,

EagleForce

Heeee, JANNUS, jij weer !

You also like to make fun of people outside the Netherlands, Uuuhh ?

And even make sick jokes about an airplane-crash ! You should say that kind
of sick things to the relatives of the people who died, then we would live
on in a world without Jannes Dekker (of Gekker?).

If you comment on something, try to say something with some sense!!!!!!!!

Yes, in the United States, most scanners including the BC-760XLT start at 30 or 29 MHz. In Europe, they start at 66 MHz because there is nothing below that worth listening to. In France, all scanners are illegal.

Open Letter to John 'Toilet Boy' Mackey, KS0F, and Usenet

For nearly five years now John, you have inflicted your petty and vile presence on the Internet in the guise of saving it from, in your opinion, the evils of Bill Cheek. In reality, your actions have been merely a smokescreen for your real motives: the expression of your true sociopathic personality on the widest possible audience.

At first, you started with FidoNet and Bill Cheek. When you attempted to disrupt and antagonize the scanner forum with your rude and abusive antics, you were admonished by Cheek to behave or face exile from the forum. Instead, you continued your nonsense and subsequently were banished. Angered by Cheek's banishment, you followed him to the Internet where you continued to stalk and attack him.

Cheek defended himself from your attacks in the same manner and vocabulary that you attacked him. You couldn't intimidate him or your most vocal critics and resorted to rogue cancellations of their public condemnations of your actions. This cost you the loss of your account with your ISP Sprint. With a new account, you continued your rogue behavior attacking anyone who spoke out against you and your lunacy.

Cheek was arguably to most vocal of your critics and had the intellectual wherewithal to rebut your stupidity. That's why he became the focal point of your attacks. While you would have people think otherwise, this is not now nor has it ever been about Mackey versus Cheek. It's about your obnoxious behavior and the people who have publicly denounced you and have openly stated they will not tolerate your behavior.

It has been well established that you are a liar and a fraud whose sole purpose is to antagonize and abuse anyone who criticizes you and that you will resort to absolutely any means to squelch your critics. John, you are like the moron in a theater who continues to talk during the movie when others ask you to be quiet. Cheek and I share one characteristic that just riles you: both of us told you to shut up and continued to tell you to shut up when you wouldn't. Literally dozens of people have also asked you in their own way to cease your bad behavior. But yet, you persist oblivious to the scorn and even hatred people feel for you. This is the true demonstration of your sociopathic personality.

Responsible backbone Internet providers have a method of dealing with rogue ISPs called the Usenet Death Penalty (UDP). This action is reserved for ISPs that continue to allow their users to spam and otherwise disrupt the tranquil interactions of the normal users. UDP is real and has been recently used against the provider UUNet (uu.net). They were sanctioned with a UDP on August 1, 1997 for allowing their customers to spam legitimate users and were unresponsive to complaints from other backbone providers in attempts at resolving the matter.

To implement a UDP, all backbone providers refuse to allow any messages from the sanctioned domain passage through their system. This effectively isolates the offender and none of the offender's messages make it to the Internet.

John 'Toilet Boy' Mackey, KS0F has, by virtue of his behavior, earned the equivalent of UDP. As one of the most outspoken vocal critics of John Mackey, I call for a UDP against him. No matter what he says or to whom, never respond. Do not talk to him or about him.

Regardless of your opinions of the late Bill Cheek, he showed that by exiling Mackey from FidoNet, civility was restored to that forum. If we follow his lead, we can achieve a similar civility on Usenet.

It's up to us.

2573. Re: Fat Mackey jealous of Love for Cheek

Newsgroup: rec.radio.scanner

Actually, the Bible never said that Jesus touched anyone (possibly whipped some people, but it doesn't say) in the temple scene. He flipped tables and stuff, but it never said that he "kicked anyone's butt". Here is the story from John 2:14. "In the temple courts he found men selling cattle, sheep and doves, and others sitting at tables exchanging money. So He made a whip out of cords, and drove all from the temple area, both sheep and cattle; he scattered the coins of the money changers and overturned their tables. To those who sold doves he said, 'Get these out of here! How dare you turn my Father's house into a market!' " There is a part that confuses me. When he says "So He made a whip out of cords, and drove all from the temple area, both sheep and cattle;". It doesn't say anything about humans, yet He says "all". The way I see it, Jesus only chased the people, but physically whipped the animals. I'll have to check different translations (I use NIV). And I am studying the Bible hard. I am reading at least three chapter a night. How about you? God Bless and happy scanning!

2578. FS: Pro-43 and lots of extras

Newsgroup: rec.radio.scanner
Date: 2000-08-05 00:00:00 UTC
From: Joe <mediawelldone@mindspring.com>
Message-ID: <398C8AB7.8E825337@mindspring.com>
Source record: 83140
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Hi, I have a pro-43, (sn007177) model no: 20-300. It is an older one and was modified for full 800. The chip was moved to another loc to enable access to other range, but I can't remember what range (aircraft ?). It was one of the cheek mods. The other mod on this scanner was the hb-232 interface. I don't think I have the hb-232 card/box any more, but it has been wired and tested as I remember blowing 200 channels into it in less than 4 minutes ! (that saved a lot of time with those tiny pads !)
Is "Commtronics" (Bill Cheek) still in biz ?
It is in great condition, but the belt clip (plastic) has a crack. I was going to replace it with one of the metal ones, but never got around to it.
Anyway, I have lots of extras too:

(1) Radio shack discone
(2) car mount antennaes
(1) grove pre-4 amp module and wire antennae
(1) original Radio shack Pro-43 service manual
(2) copies Radio shack Pro-2006 service manuals
(1) original Radio shack Pro-2004 service manual
(1) original Radio shack Pro-2005 service manual
(1) original Radio shack Pro-2010 service manual

If you'll give me a few days, I know I'll be able to dig out all the Cheek modification manuals and approx 30 scanner mags from about 5 years ago (monitoring times, pop comm,..)
I think I have a bunch of scanner books for Massachusetts to throw in also

I really don't know what all of it is worth, but if someone wants to make a reasonable offer, I'll weigh all offers as I'm moving and need some cash to boot. If not, I guess ebay will have to help out :)

I also have a box of electronics (resistors, capacitors, chips, breadboards,... you get the idea). Has to be around $500 in retail, but again, I'm in a negotiating position on that. I'll try to inventory it and mail anyone who is interested.

Please be patient in my response as I have finals these next two weeks and we're packing !

Thanks folks,

regards,
Joe

2579. Pro-91 Low Battery beeping

Newsgroup: rec.radio.scanner
Date: 2000-08-05 00:00:00 UTC
From: Alex Pazaratz <alexp@netcom.ca>
Message-ID: <01bfff26$973a8c60$306e7bd8@alexp.netcom.ca>
Source record: 83141

Does anyone know a method to disable the beeping associated with the "low battery" indicator? Often I get a low battery reading even though there's plenty of life left. I know how to disable the keypad sounds, but it would be helpful to completely disable the low battery beep. Thanks. Alex Pazaratz, Hamilton, Ontario.

I have an R-8500 and tried to get a service manual for it.... Although it
is avaialable it has to be oredered from Icom Japan. Owners manuals, yes no
troubles but a proper service manual, no such thing unless you order it in
and then be prepared to pay for it.... about $25 US.
Maybe you will have to contact Icom Japan too... or even better try Icom
US...

>
>To date, no plane has ever crashed due to a cell phone or cd player.
>
>

Just in my humble opinion I think that some of the above is not totally
correct....
I am no electronic wiz but I do know enough about simple transmitter
circuitry to realize that a huge amount of electronics equipment, be it a
cellphone, CD player or a childs toy, can and usually does emit many
unnoticed spurries, tones and other transmitted frequencies simply by the
sometimes cheap and nasty circuitry they have in them... There is no such
animal as a totally shielded device (either shielded from transmitting or
receiving unwanted frequenices).... By their nature, almost any combination
of electronics components will emit some sought of transmitted frequency
once a current is passed through it....
It is these unwanted frequencies that can be picked up by sensitive
equipment in the plane that you may be seated in... Now maybe it wont cause
a plane to drop out of the sky BUT it may cause some equipment to give a
false reading or even malfunction or fail which could induce further action
by other instruments or one or more of the crew....
No, it may not be the entire cause of an air accident but it may not do any
good to enhance a trouble free flight....
Do you ever listen to HF radio? If so... how many washing machines, TV's,
phones, neon lamps, microwave ovens, vacuum cleaners, car ignitions, badly
connected wires and a multitude of other electronics devices do you pick up
with your receiver.... I'll tell you - MILLIONS.... It's all the same

principle... They are all emitted from electronics devices and cause interference in the device which is purpose designed/built and more sensitive to radio frequency...
So much of a planes circuitry too is designed around anti-static buildup whilst in flight. Stray emissions can upset these too....

I have spoken only to a few pilots in the past and every one of them knows absolutely nothing about radio or electronics but they do know their stuff about planes..... and their word is good enough for me.
It would be of little consulation to know that is wasn't my cellphone that made a pilot deviate from his heading and bump into another plane, as we fall from the skies... 35,000 ft is a little too high to dice with danger or ignorance...

My Radio Shack PRO-94 is made by Uniden. I can't compare it against
other scanners due to lack of experience. However, as I have gotten
used to how it works and learned to live with the limitations of the
little `rubber ducky' antenna, I think it is pretty decent overall.

It picks up the local HAMs pretty well. Too well. Now I want to be
HAM myself. So little money, so many toys ;-)

I was surprised when I read that the brain dissipates 100 watts of energy.
The small amount of RF from a 600 mW phone is probably not concentrated
in a very small section of the brain. However, I would start worrying if my forehead got hot
while using a transmitter. Or if a candy bar melted in my pocket, which is what led to the invention of the microwave oven.

Well sir, that just isn't good enough. Why do you think that avionics must be TSO'd to be used on airplanes? And that goes for all of the transmitters, such as TACAN DME and transponders, not just AM voice comm. It doesn't take much interference to cause accuracy degradation on some VHF navigation equipment. Some of the systems on today's transport aircraft are highly automated and may be susceptible to some interference. No, turning on a cell phone may not cause the plane to fall out the sky, but it represents a risk that the airlines are not willing to impose.

> The ONLY reason cell phones aren't allowed on planes is that your cell phone

Negative. That statement is the ONLY reason why the FCC bans cell phones per se, not the FAA FARs and operator rules.

> A handheld walkie-talkie on a plane over Texas talked to me on my

But what kind of plane was it? What electronics was it relying on? Was it operating under IFR?

Your knowledge appears to be quite lacking with respect to transport avionics systemes for a statement which you express so strongly.

> To date, no plane has ever crashed due to a cell phone or cd player.

Where did you find this statistic?

I didn't find any evidence in the referenced material above to support your claim of "never realized" or "refuse to acknowledge." A cell phone is transeiver, and cell phones are not specifically mentioned in the FAA regulation mentioned above. Cell phones ARE specifically mentioned in the FCC regulation which prohibits their use aboard aircraft in the United States.

I have been considering upgrading my base station scanning capability. I wonder what the options may be? I am currently using a Pro 2006 and a BC895XLT. I am looking for keeping the trunking capability, preserving mil air and a storage capability of at least 400 channels.
Regards,
JIm

> be used.

Under FAR Part 121, the "operator" must determine that it is
safe. "Operator" is defined elsewhere in the regulations, and
it's not the flight crew. It is the airline, and each airline
will publish a list of permitted electronic devices in its Flight
Operations Manual. That's why some airlines allow GPS units
while others don't. No airlines allow cell phones. Because it's
not permitted by the operator, they are prohibited under the
FARs.

> AFAIK, the bottom line is that the FAA can't unilaterally bust somebody

I'd be careful with that if you're flying IFR under Part 91.
Personally, I'd be hard pressed to argue to the FAA that I had
determined it was "safe", when no other FAR 121 operators agree
with me. What criteria did you use to make that determination?

Instead of getting more scanners, why not look into connecting both your scanners to a computer (Unless you already have). Both of those units are great for this purpose; you'll need the opto board for the 2006 though. With the right software and connections you can get both radios to trunk both motorola and edacs systems, track mil aero and have as many memory channels as your computer/software can handle.

Last time I checked, they were still available from RadioShack.com (formerly TechAmerica.com). Look for the HamComm interface. As for plans, I know they are available at many sites, including the National Weather Service, which uses them to decode EMWIN signals (Emergency Managers Weather Information Network).

Source record: 83230

I have been wanting to get a scanner for some time, but school and jobhunting kept getting in the way. Last weekend, at a garage sale, I found an old scanner for practically nothing, and decided why not?

I'm sure that it's hopelessly out of date and many of you wouldn't consider it worth the bother, but it's what I've got, and I would really appreciate any help you guys can offer. It didn't come with a manual or anything. (I'm lucky it came with a dinky antenna and something to plug it in with ;-)

It's a Uniden Bearcat 147XLT. There are six buttons, labeled "Scan," "Manual," "Review," "Lockout," "Priority," and "Weather," plus a numeric keypad with a decimal and an E. There are two knobs, Volume and Squelch.

Does anyone out there have an old manual they can copy for me? Or is anyone willing to talk me through the use of this thing? I plan on fiddling with it and figuring out what I can, but I'm sure I'll miss *something* good that way.

And are there any mods for this model? I'm positive the warranty isn't an issue here. <eg>

I live in Chicagoland, pretty close to Pauwaukee airport, so I'm sure there's something out there to listen to. Probably quite a lot. Any good frequency lists for the northern 'burbs you can point me to?

Thanks in advance for any help anyone can give me! And if I can't get the darn thing to work, at least I'm not out much, and I still have the option of getting a *real* scanner some day, right? ;-)

2613. Re: OT: The death of cellular! Brain cancer victim sues for $800 million!

Newsgroup: rec.radio.scanner
Date: 2000-08-05 00:00:00 UTC
From: David Steuber <nospam@david-steuber.com>
Message-ID: <m3ya2cs100.fsf@solo.david-steuber.com>
Source record: 83231

"Al, N2NKB" <n2nkb@n2nkb@postoffice.worldnet.att.net> writes:

' I was surprised when I read that the brain dissipates 100 watts of energy.
' The small amount of RF from a 600 mW phone is probably not concentrated
' in a very small section of the brain. However, I would start worrying if my forehead got hot
' while using a transmitter. Or if a candy bar melted in my pocket, which is what led to
' the invention of the microwave oven.

My skin temperature varies with all sorts of things. Including
whether I just ate. And of course the warmer the skin is, the faster
you loose body heat.

Microwave ovens use radio waves tuned to the harmonic frequency of
water. Other molecules have harmonic frequencies in that range, so
the oven also works on fats (which usually also contain water) and
sugars.

This is not to say that standing near an antena can't warm you up. I
know of one incident where a radar technician got a quick cook by
getting in front of a ground based airport radar antenna. He came out
medium rare in one sweep. It is really a question of how quickly you
absorb the energy (power) vs how quickly you conduct/radiate it away.
It doesn't take much energy to injure you. But to cause chromosome
damage that does not kill the cell so that the damage can then create
a mutan cell is requires a combination of ionizing radiation and bad
luck. This is where exposure to risk comes in. The longer you are
exposed to ionizing radiation, the larger your chances are of
contracting some form of cancer.

Interestingly enough, some cancers are cured by cooking them with
ionizing radiation that is focused on the particular growth in
question. When you blast apart the DNA, you usually kill the cell.

Now if you want to wrap yourself in aluminum foil, that is your
choice. But consider this. Some parts of your body need to be cooler
than core temperature. There is a sack of such structures located on
most males. Heating those suckers up can reduce motility. To foil,
or not to foil. That is the question ;-).

I didn't mean to single you out. And I certainly wasn't scolding anyone. Please don't take my comment as a personal attack on you or your religion. I realize you didn't mention that you were a religious person, but it was quite obvious in your postings.....

>God loves those people just as much.....

>"the wages sin is death, but the gift of God is eternal life, through Christ Jesus our Lord". - Romans 6:23.

>I consider myself very fortunate to be loved by
>God.Because I know that God loves me.....

>we are all created equal under God's eyes.....

>Until then, I'll pray
>for you. God Bless.

Nothing wrong with being religious. I wish more people were. (more are than most people think)

You commented .....
>It seems like people will go out of their way to find
> fault in Christians.

That's not what I was doing. I just pointed out your hypocrisy. You get upset because someone posts that someone else is a "retard" (he is) You even recite scripture.....
Yet you comment that you would kick his ass if you had been there to hear him say it.

WWJD?

The FCC simply 'interprets' manufacture to include ANY modification of a
scanner to receive 'banned' frequencies.

Scanner operate under Part 15 of the FCC Regulations (because of the local
oscillator) In Part 15, we find:

Sec. 15.9 Prohibition against eavesdropping.

Except for the operations of law enforcement officers conducted
under lawful authority, no person shall use, either directly or
indirectly, a device operated pursuant to the provisions of this part
for the purpose of overhearing or recording the private conversations of
others unless such use is authorized by all of the parties engaging in
the conversation.

And, the kicker:

Sec. 15.121 Scanning receivers and frequency converters used with scanning
receivers.

(a) Except as provided in paragraph (c) of this section, scanning
receivers and frequency converters designed or marketed for use with
scanning receivers, shall:
(1) Be incapable of operating (tuning), or readily being altered by
the user to operate, within the frequency bands allocated to the
Cellular Radiotelephone Service in part 22 of this chapter (cellular
telephone bands). Scanning receivers capable of ``readily being altered
by the user'' include, but are not limited to, those for which the
ability to receive transmissions in the cellular telephone bands can be

added by clipping the leads of, or installing, a simple component such as a diode, resistor or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip using special access codes or an external device, such as a personal computer. Scanning receivers, and frequency converters designed for use with scanning receivers, also shall be incapable of converting digital cellular communication transmissions to analog voice audio.
(2) Be designed so that the tuning, control and filtering circuitry is inaccessible. The design must be such that any attempts to modify the equipment to receive transmissions from the Cellular Radiotelephone Service likely will render the receiver inoperable.
(b) Except as provided in paragraph (c) of this section, scanning receivers shall reject any signals from the Cellular Radiotelephone Service frequency bands that are 38 dB or higher based upon a 12 dB SINAD measurement, which is considered the threshold where a signal can be clearly discerned from any interference that may be present.
(c) Scanning receivers and frequency converters designed or marketed for use with scanning receivers, are not subject to the requirements of paragraphs (a) and (b) of this section provided that they are manufactured exclusively for, and marketed exclusively to, entities described in 18 U.S.C. 2512(2), or are marketed exclusively as test equipment pursuant to Sec. 15.3(dd).
(d) Modification of a scanning receiver to receive transmissions
<---
from Cellular Radiotelephone Service frequency bands will be considered
<---
to constitute manufacture of such equipment. This includes any
<---
individual, individuals, entity or organization that modifies one or
<---
more scanners. Any modification to a scanning receiver to receive
<---
transmissions from the Cellular Radiotelephone Service frequency bands
<---
voids the certification of the scanning receiver, regardless of the date
<---
of manufacture of the original unit. In addition, the provisions of
<---
Sec. 15.23 shall not be interpreted as permitting modification of a
<---
scanning receiver to receiver Cellular Radiotelephone Service
<---
transmissions.
(e) Scanning receivers and frequency converters designed for use with scanning receivers shall not be assembled from kits or marketed in kit form unless they comply with the requirements in paragraph (a) through (c) of this section.
(f)(1) Scanning receivers shall have a label permanently affixed to the product, and this label shall be readily visible to the purchaser at the time of purchase. The label shall read as follows:

WARNING: MODIFICATION OF THIS DEVICE TO RECEIVE CELLULAR RADIOTELEPHONE SERVICE SIGNALS IS PROHIBITED UNDER FCC RULES AND FEDERAL LAW.
(2) ``Permanently affixed'' means that the label is etched, engraved, stamped, silkscreened, indelibly printed or otherwise permanently marked on a permanently attached part of the equipment or on a nameplate of metal plastic or other material fastened to the equipment by welding, riveting, or permanent adhesive. The label shall be designed to last the expected lifetime of the equipment in the environment in which the equipment may be operated and must not be readily detachable. The label shall not be a stick-on, paper label.

L.A. City Fire Department is certainly way ahead of most other agencies I'm aware of in actually INVITING citizens to monitor them and even to participate in Communications-related activities.

A coupleof their pages to check out:
http://www.lafd.org/audio.htm "Live Streaming Audio" (plans).
Included is info on their digitized voice dispatching system, with the highlighted line: "Our change to the digitized human voice for alerting our Fire Stations has no effect whatsoever on your ability to monitor LAFD tactical channels on a scanner radio." and "The LAFD operates a fully repeated radio system. All of our routine tactical voice communications can be monitored almost anywhere in Southern California. All that is required is a readily available 800 MHz scanner radio. We encourage those living in or visiting Los Angeles to network with local monitoring enthusiasts < http://www.socalscanner.com/ > for more information. To make things easier, we are happy to provide a complete list of LAFD Voice Radio Frequencies < http://www.lafd.org/freqncy.htm > to program into your scanner radio.

And their Amateur Radio "Auxiliary Communications System" page at http://www.lafd.org/acs.htm which says, "Those who are in Los Angeles and would like to participate or monitor, the LAFD ACS Radio Net operates each Monday night at 7:30 PM local time. Those interested can check in on or listen to:

147.30 MHz (+) PL-110
-or-
224.68 MHz (-) PL-114"

MC 10kW Jesus <qsl27@hotmail.com> writes:

' The Prince of Darkness has a name. It isn't Satan, it's Lucas.....

I discovered that as a young lad at a car dealership. At the time,
the Sterling was available (Made side by side with the Honda/Acura
Legend) at the dealer I worked for. Many of the cars had electrical
problems. The most amusing one was when I used the remote to lock one
car and it started going nuts. The locks started actuating very
quickly, along with the lights and $DIETY knows what else. Smoke was
comming out of the dash before I could pop the hood and disconnect the
battery.

As for the Concorde... It is believed that it ran over a cellular
phone which then blew out a tire and ruptured a fuel tank. The FOD
took out the two starboard engines. Considering the 246mph take off
speed vs the 189mph landing speed, I would say that plane hit stall
speed within about five seconds of the loss of those two engines.
Nothing for the pilot to do but watch the ground come up to meet him.

It really sucks when you think about it.

There's some basic info...and "how to" get a manual, at
http://www.uniden.com/docs/product/prdetail.cfm?product=BC147XLT-1

Basically, you press [MANUAL] [1] [MANUAL]; then punch in the freq you
want, like 154.43, then press [E] (for "enter").

Then press [MANUAL] again, gets you to channel 2, and enter another
frequency...

Once you get some in, hit the [SCAN] button to scan. The [SQUELCH] knob is,
basically, sensitivity. On a quiet channel, turn it til it gets noisy (a
static "hiss" sound), then back it off till it's quiet.

It ought to be good enough to get you started...though I don't believe the
147 gets the aircraft frequencies specifically. Do you have frequencies for
your area? If not, what city/county are you in...what do you want to listen
to?

Many scanners have a gap in coverage, cotting off at 174 and picking up
again at either 380 or 406. You apparently have one of these. There are
several scanners that do not have a gap in this coverage.
The ones that I'm most familiar with are all discontinued models now.
Perhaps someone else can reply with more current models, or perhaps you may
find one of these on the used market. Uniden NC 2500xlt - 3000 xlt.
Realistic Pro 26 (and I think the pro-43,
pro 2004-2005-2006-2035-2042, AOR 8000 series, AOR 5000.
As for modifrying your existing scanner - I'm not an engineer, neither
do I know what scanner you are currently using - but generally speaking I
think modifying a scanner for extended vhf coverage is in most cases -
impossible; and in all other cases - impractical.

The trunked Detroit system, since it is basically a technical failure
in terms of coverage and reliability, is used only for utility
services communication, not police or fire (the "People Mover" police
does use the trunked system, but it's not very active there). The
only "excitement" to be found in the trunked region is around
Halloween-time when the Detroit utility portable radios are given to
the citizen patrols for prevention of "Devil's Night" fires. Then,
the trunked system is quite interesting. However, the regular
activity on the trunked system is pretty boring.

Hi Everyone,

To get to my page of Seattle-Area Scanner Frequencies, please
access the Giant Page O'Radio Links, here:

http://swlinks.webalias.com

Includes cell phone frequencies and 800 MHz trunked freqs.

The link is located right above the main LINKS section. Please
do not bookmark the page separately, or you may find it gone
some time in the future. SWLINKS.WEBALIAS.COM is accessed
through a redirector and will ALWAYS be there.

Happy Listening,

W.

It is amazingly hard to find an ac adapter without at least SOME hum. The regulated ones do not hum but usually put out their own funny noises on RF.

One partial solution is to get a set of RF chokes (Ferrite), available at radio shack (they look like rectangular plastic things with pieces of ferrite in the middle), and wrap the wire coming out of the adapter around one or two of the chokes at the point it enters the radio, as per instructions. Cuts down some on hum.

But the sad fact is, I run most of my radio equipment on BATTERIES, for absolute lowest noise and least problems. And that GRE super amp goes thru 9V batteries like they're going out of style. I bought a 9v NiMH battery to run the thing.

It's hard to judge the differences between the U.S. and South Africa, since I know virtually nothing about your country's history, especially in the political realm. In a nutshell, the U.S. was created by mostly British colonists, many of whom had fled England for religious or other freedom. So from the beginning I guess we've had a strong, inbred leaning toward individual freedom, even despite the occasional problems when freedom is confused for "license" to do ANYTHING: anarchy.

One frequent contributor to some of the radio email groups has a reference in his "signature line" to a statement made by U.S. Supreme Court Justice Potter Stewart, ""Censorship reflects society's lack of confidence in itself. It is a hallmark of an authoritative regime."

So, at least until now anyway, we've managed to hang on to most of our rights to listen to our scanners. It's now illegal to monitor cellular or cordless phone calls, though, as well as pagers, and a few other esoteric types of transmissions. Hopefully the other fellow is wrong, and we won't lose all listening rights.

I suppose there are a number of reasons offered for prohibiting scanner listening, but I wonder if many times the real reason is to keep government's activities secret, lest shortcomings, mistakes, corruption, etc become public knowledge. I can understand the "need" to keep certain police activities secret, such as surveillance of truly dangerous persons and activities, and generally when officer or victims' safety is likely an issue. Two such circumstances might be imminent raids of potentially dangerous locations, and communications regarding a hostage or kidnapping incident.

Also, some people assert that police radio calls are often filled with information about totally innocent people, and may be misinterpreted or may place these people in some danger. I can think of domestic violence situations, where the officer may be directed to the victim's location...a location where she (or he) is hiding from the suspect. I'm sure there are other similar examples, where personal safety or privacy concerns might arise.

However, having been a scanner listener since the 1950's (before they even "scanned"), and also a police and fire dispatcher, I know for a fact that the overwhelming majority of police radio traffic doesn't fall at all under those scenarios. They're about traffic collisions and violations, robberies that have already occurred, non-violent civil disputes, "cold" crimes of various types...stuff that is neither "sensitive" nor even very interesting to most people.

Fire and EMS radio frequencies would seem equally innocuous in most all circumstances. Criminal activity or privacy issues are seldom involved in these broadcasts.

I have seen no statistics about it, but I suspect that, as much as we American scanner listeners like to complain about the government threatening our hobby, our country is probably among the least restrictive in this regard. I would be curious if anyone has compiled some sort of information about scanning laws worldwide. Even within the U.S., by the way, scanner laws vary quite a bit from state to state. I refer you to http://www.panix.com/~clay/scanning/rules.shtml and http://www.afn.org/~afn09444/scanlaws/ as examples of how nit-picky we sometimes become!

Finally, and I'm too tired to re-write the last paragraph, I just came across a site that's intending to list scanning laws for countries around the world...perhaps you could advise them of South Africa's laws; it's at http://www.strongsignals.net/htm/laws.htm

Whew!

Only because you have none to burn John-Corky. Do you notice there are
always 20 to 30 people calling you a liar and asking you to leave yet rarely
does anyone ever defend you. Oh I know there are a few, maybe even 1 or 2
you didn't make up that will on ocassion make a remark remotely in support
of you but hell, Jeffery Dahmer and Ted Bundy had a few supporters too.

Don't take my word for it John-Corky Mackey, hold a straw poll on the NG and
find out for yourself, history certainly is lost to you.

Says it all and you couldn't defend yourself against any of it. The truth
hurts yet rather than shut up and go away you snip and pretend like it never

happened. You are at best a 11 year old in denial, acting out for attention. Duh! You actually repeat my last line later as if it was your idea. What a bloody fool!

> Glenn, there are only a few who are unhappy with me, FAR less than 20 or 30.

Wrong, there are at least 20 that have asked you to leave for over 4 years. Take a Poll Corky John-Bowl. You can't. HAHAHAHAHAHA!

> The number of people who dislike you is far higher.

I really doubt that, but it wasn't the issue. I have never debated it one way or another, it is John-Corky Mackey we are talking about. It is you, John-Corky Mackey that denies people hate him, most people on here. Take a Poll John-Bowl, prove it or be shown a liar.

> Don't take my word for it Glenn, hold a straw poll on usenet and
> find out for yourself, history certainly is lost to you.

As we all can see John-Corky, you have to steal my ideas too! Did you think nobody would notice? What a putz. Take a poll John-Bowl, go for it!

> People won't
> forget your
> antics, such as the trouble you have made on *.radio.scanner & on
> rec.radio.swap.

Only in your mind Toilet-Corky. You are the only person to mention this, 6 years running. Just think Corky, you have been a jackass for more than 6 years on the newsgroups. The ONLY thing you are known for. Jackass JohnBowl-Corky. Wow. No scanner knowledge, smokes repeater, bed wetting, problems identifying positive and negative when installing equipment, mental health aide, bed pan changer and a drunk. That is your legacy John-Bowl. That is what most think of when they hear your name. Impressive. Hold your poll fool.

I have a Motorola GP68 VHF 20 channel for sale or trade. This unit is in MINT condition and will be shipped in original box. Includes: rapid charger, ant. and batt.
I would be interested in trade for GP68 UHF or other UHF handheld. I will also entertain cash offers. Please reply to tim@tabol.com

Thanks
Tim

You couldn't be more incorrect. Fat Ugly Corky Mackey
with the big ugly gap between his front teeth is the
biggest horses ass of all time.
Mackey the cork is everyones kicking bag of shit.
I absolutely know he isn't enjoying this at all. One
of his parg buddies is giving us some interesting
inside information. He really hates having to answer a
ll these postings about himself.

I was hoping that someone might have mods for my Pro2037, detailed instructions would be useful.

Also along the lines of use of op-amps to regulate voltage while connecting a recorder directly to the scanner with VOX.(if anyone can show just how to hook it up, i'ld be grateful)

Hopefully someone might have this kind of information for me?
Thanks in advance.

Its certainly too bad that the bible wasn't originally written in modern English. So many translations that, perhaps without knowing , someone puts in their own interpretation of an event, accurate or not.
Though I never considered the bible to be an accurate journal of that time. Know what I mean, kind of like a movie that changes some of the info in a true story to make it more interesting. Yet, the story is still basically the same. I don't think it takes anything away from its validity.

"The Kolari's" <rakolari@cyberbeach.net> wrote in message news:XS_i5.11747$D11.13406@newsfeed.slurp.net...

Nope. As the original law was written, monitoring of all subcarriers was forbidden. When it was pointed out to the KongressKlunks that TV sound and FM Stereo worked on subcarriers, the law was rewritten to exclude only those subcarriers and the standard FM subcarrier for Public Service (reading for the blind mostly) at 91 KHz. The biggest SCA user was Muzak (67KHz) and since they went microwave the impetus to beat up on people monitoring subcarriers went away but it's still illegal.

Monitoring studio feeds is illegal too. These are spread out all over so it'd be difficult to block a scanner for this.

Some old satellite 2 GHz TVRO receivers with the big dishes (The older ones - the newer ones fell under the EPCA.) had a subcarrier output jack that had some interesting stuff on it that you could listen to with an all-band receiver.

I have no idea what's possible with the newest satellite TVROs - the 18" dish kind.

Some cable systems have strange subcarrier stuff running around too.

I've created an Excel spreadsheet with frequencies I think may be helpful if you're interested in scanning during this years Offutt AFB airshow August 26-27. My thanks to all whose sites I've visited in the pursuit of this listing. If you would like a copy of this spreadsheet, drop me an email (russell768@aol.com) and I'll send it out to you. I can't validate any of the freqs listed, I pulled some from places which had not been updated for years in some cases. If you notice any errors or have additional freqs which can be added to it, please let me know and I'll update my list as well.
Thanks.

Regardless, it's still bad legislation, passed for bad reasons, and as
such, should be ignored anytime possible in the hope of getting people
to wake up and realize that it IS bad legislation, and get it removed.

Here's my stance:
If somebody's gonna toss it up in the air, beam it through my house, my
body, my cat, or whatever, then I've got every right in the world to use
my <insert any of several devices, modified or otherwise, here> to
intercept it. If you don't like me knowing what it is you're
saying/showing, then you better use a secure encryption method,
otherwise, I consider it fair game.

You're the one standing there screming it at the top of your electronic
lungs for anyone with the equipment/know-how to hear. Don't come crying
to me about "privacy" concerns when you don't do anything to keep it
private, short of lobbying for a ridiculous, unenforcable law. If you
want what you're transmitting to be private, then you either need to
encrypt it securely, or don't *braodcast* it in the first place.

Source record: 83018

alone I could sell the Pro-51 for at least $170 on E-bay but I have decided to
sell this entire package
for $230 with shipping and handling to be paid by me:

Includes Pro-51 scanner with images in the 896.1125MHZ - 915MHZ
range, I think we can a assume what the images are.

-comes with telescopic aetenna

The Sony ICF-SC1 I bought from J&R,

-power adapter
-manual
-telescopic aentenna
-used for 2 months

The HTA-20 2 meter 30 watt amplifier for your shack

-includes 3 foot RJ cable extension

Extra: A CD-Rom full of ham radio and scanner mods.

E-mail if interested. I'm getting out of the shack'in biz.

Scott,

The Thunderbirds use a discreet UHF frequency between the team and their
com trailer during the show, for safety reasons.

2660. Detroit, Michigan Freqs?

Newsgroup: rec.radio.scanner
Date: 2000-08-06 00:00:00 UTC
From: Bill Crocker <bcrocker@home.com>
Message-ID: <h2lj5.59745$fR2.612762@news1.rdc1.mi.home.com>
Source record: 83021

When monitoring the City of Detroit, from Warren, Michigan, I normally scan their assigned frequencies in the 453MHz band. This seems to be very active, and cover most of the riff-raff. How active are Detroit's frequency assignments in the 850MHz trunked band? I've never taken the time to key it in, and I'm wondering if I'm missing anything?

Thanks,
Bill Crocker

It is only illegal to use SCA signals at a business or public place
without paying the provider. SCA is a leased service, rarely provided
by the station delivering the signal. You can use it it home, but the
bandwidth and noise figures are poor, compared to the baseband signal.

2662. GRE Scanner Data Manager, PRO-92

Newsgroup: rec.radio.scanner
Date: 2000-08-06 00:00:00 UTC
From: Bill Crocker <bcrocker@home.com>
Message-ID: <Y5lj5.59747$fR2.612909@news1.rdc1.mi.home.com>
Source record: 83023

I've been playing with GRE's Scanner Data Manager software, and interface cable, for the Radio Shack (GRE) PRO-92 scanner. Although it only allows loading, and backing up of data, and not actual "control" of the radio, I find it to be very good! It makes programming the PRO-92 fun, and easy. Now I can finally make use of the alpha tags, not only for the city, but the trunked codes as well!

Highly recommended!

Bill Crocker

The older systems were at 4 GHz, not 2 Ghz. The same applied to the
subcarriers as FM broadcast. Not legal in a public place, or business
location.

That's correct. And subcarriers on FM are not totally unused. Some
stations have several. Most of the programming is available by
subscription, as was the Physicians Radio Network, with receivers
tuned to the station in question, and the correct subcarrier
provided as part of the subscription service.

So, in some cases, subcarrier monitoring is not only illegal, but
it is theft of service.

This is simply not true. Not since the latest revisions of
communications law. It is illegal to monitor SCA without a lease
agreement, or subscription, no matter where the monitoring is done.

> SCA is a leased service, rarely provided
> by the station delivering the signal. You can use it it home,

No, you may not legally do so at home.

> but the
> bandwidth and noise figures are poor,

Yes, they can be pretty dreadful. And if the station is processing
with hard composite clipping, the receiver hears baseband transients
in the SCA audio.

We carried PRN for years on one station I worked. Composite
clipping was all the rage throughout hte market. But composite
clippers were not very sophisticated, so we daily got complaints
about the cymbal crashes that punctuated a treatise on pancreatic
surgery, or how to a D & C and still make you tee-time. It wasn't
very engaging programming.

And PRN did crack down on pirates. I don't have the first clue how
they caught them, but we'd get the reports every month, the number
of non subscribers caught listening.

Are you sure that electrons have to be knocked off chromosones in order for damage to occur?

If heating causes circulation increases, won't that cause faster growth of any tumors or cancer cells that exist?

What was the latest finding from the Cellular association that caused their researcher to say that a problem might exist? Wasn't there some study with mice that showed damage caused by radio waves? (about a year ago)

Nope. Not me.

I think this sucks too. The only thing I find astonishing is that there are still scanners and a monitoring public. We're going to go through a similar thing with scanners, etc. as the gun folks are currently enjoying with their hobby. I'm waiting for the first activist to proclaim a scanner or a short-wave radio hurt a kid...

Kinda OT but see this: http://www.frenchu.com/tpg/drill.html

Why do you have to constantly bitch about it ? What do you want ? people`s life history ? would you like a copy of my drivers license, and my social security number, along with my name and address, and all the names of my family ? What ? Why should I open myself to this kind of thing ? There are enough nut cakes and people spying on the internet (and elsewhere), already, without making it easy for them... Anyone with any sense at all does not use his own name on his postings.... You would be opening your entire life up to every froot-loop and loonie on the internet !
I dont think you really have a handle on what can be done, just using a name as a starting point.... Maybe you should investigate what can be done....

Can anyone recommend a decent antenna for this application? I'm in a typical deep suburban location with aluminium siding. My radio picks up the desired station using its' attached whip, but it's noisy.

I've got lots of room in the attic and the wire run would be about 15 feet tops. What do you think?

TIA,
Carl Van Camp

with a walkie talkie, I talked with someone using a walkie talkie on a plane over Texas while I was in Chicago. A cellphone would have interfered with every cell site for at least that distance in every direction from a plane.

Also note, the plane never crashed from using that walkie talkie on that plane.

No consumer grade equipment has the ability to affect any equipment aboard any aircraft.

> FAA regulations don't give a hoot about tying up cellular systems,

They must abide by the law whether they give a hoot about it or not. I don't give a hoot about people like you, but the law still doesn't let me kill you.

> And speaking of law, the captain of the plane, command pilot, pilot in
> charge, whatever term you wish to use, has the final say on the usage of

No one disputes this, NOR does it even closely relate to the issue that cellphones do not interfere with any navigation equipment, only the cellular system.

> Mark K5MAR

You should know better having a Tech Ham License, but then again, if you did, you wouldn't be posting your call sign on a newsgroup so everyone knows your home address. Not a very wise thing to do nowadays on a newsgroup.

You can buy an amp from MJF that does a good job better than the Rubber
Duck.

i actually work for radio shack and have set many of the mobile scanners to work with our 12v (i think 500mAh) adaptors. I have never heard them hum. If the unit is under 90 days return it for an exchange. If you find a new unit is still doing it, call 1-800-the-shack for tech support.

Stephen,
You keep confusing equipment DESIGNED and CERTIFIED for use in aircraft that have antennas on the OUTSIDE of the aircraft with consumer-grade equipment that is NOT designed for use in aircraft, being used INSIDE the aircraft. FAA regulations don't give a hoot about tying up cellular systems, their concern is the safety of the aircraft, it's systems, and the occupants. The regulations regarding consumer electronics on board a civil aviation aircraft were in place long before cellular systems were established. All avionics (aviation electronics) have to go through a stringent testing procedure to certify that they won't cause an interference problem with any other aviation system before they can receive certification that allows them to be installed in aircraft. That is why aviation radios are so much more expensive then their commercial-grade counterparts. Compare the price of a GPS unit you can use in your automobile with one that is certified for use in aircraft. And while current consumer equipment might not cause an aircraft to crash (as you say), the FAA rules state that non-certified equipment can't be used while in flight. Why is that so hard to understand? Like the commercial on TV says: "It's the LAW!".
And speaking of law, the captain of the plane, command pilot, pilot in charge, whatever term you wish to use, has the final say on the usage of any, repeat, ANY consumer electronics on board a commercial flight. His word is LAW. That is FAA rules, and also the rules in many other countries. Remember the Concorde crash a couple of weeks ago, where the pilot refused to fly the plane until the thrust reverser was repaired, even though the plane was certified by the airline as safe to fly? The plane didn't fly until the problem was repaired. (And this has pretty well been shown not to have had anything to do with the fire and crash.) Refusing to obey a captain's orders on board an airliner is a federal crime. If he (or his representative such as first officer or flight attendant) tells you to turn the off your cellphone, CD player, or whatever, and you refuse, you will likely be arrested and jailed for the federal crime of interference with a flight crew. And the argument in court won't center on whether or not it was safe to operate the equipment. It will be on whether or not you refused to obey the captain's lawful command. In this type of case, the FAA regs say the captain is right, his is the final word on aircraft safety.
Got it?

Whoa, hold on. All he said he wanted was Type II trunking. There are
lots of Motorola units that will do that. Astro or XTS3000s are only
needed if you want digital transmission modes.

As for the STX, I think you are out of luck though. I could be wrong,
but I think they are Type I only.

I haven't, I was just being facietious. Using 121 operators as a
benchmark isn't always appropriate. IFR minimum take off
visibilities/cielings apply to commercial operators but do not apply to
Part 91 operations. For instance, I can take off under 0/0 vis and you
can't. Yes, we're told, "if it's not safe for commercial ops to do it,
neither should you." But the fact remains that we can legally (it's not
the same as safe, I know) get away with stuff that you can't.

> a scanlist except via a computer.

Er... I think that "some" needs explanation. Yes, some STXs do Type II
just fine. Some STXs do Type I just fine too. The problem is, the
controller is either Type II capable or it's not. There is no "upgrade"
per se. Based on his question, he's clearly got a Type I controller in
his STX. That being the case, if he wants Type II he's going to have to
replace the controller (at a cost far beyond the cost of buying a used
Type II STX outright). It seemed easier at the time to just say 'no.'

My current scanner is a BC235XLT. Follows the trunked frequencies around here just fine, easier to use than a 245 or 895, but lacks the computer control (which I really don't need). I've never been that big on computer controlled receivers, and 300 channels is more than plenty.

Picked this scanner up for *$99* from Grove Enterprises used equipment (excellent condition, and comes with a money back guarantee). Go to www.grove-ent.com and look in "Bob's Bargain Bin." If it has not been recently updated, call Grove and see if the scanner you're looking for is available!

You can take a test for $6.70, I assume you are in the US, and get a second hand 2 meter for $100.00 or a new mobile/HT between $170-200. With the no-code Tech license it is easy to have family members study along with you and you all take the class together and you can use ham radio to keep in touch.

This is amazing - scanning is actually illegal in South Africa, and you can
get a jail term for doing it...

Why do you think it is not the same in the US? I cannot see a problem with
it - especially since on our channel we use a set of radio codes that nobody
who is not trained will not understand anyway?

I have never been able to see the use of such a law preventing it...

There are many people in this newsgroup who predict that owning a scanner will eventually be illegal here in the US also (like your country). Who knows?

If scanners are illegal it could only be to protect your privacy.
Encryption is also illegal. That is so the government can violate
your privacy. This is not a problem, so long as you have nothing to
hide.

I just want to point out that computers were mentioned at some point
in this thread. Consumer electronics from walkmans to laptops are
allowed on planes. The new planes all have outlets for you to plug
your computer into!

I don't know what the deal is with cellular phones. If there really
are concerns by the FAA and NTSB that low powered EF emmisions could
bring down an aircraft, I think they would be screening these items
out of you carry on baggage. They don't do this.

I don't know what this is all about. All I know is that I skip a
whole lot of messages in this group.

There is a very simple rule that I follow on usenet. Don't feed the
trolls.

That is all I have to say on the matter.

```
' You can take a test for $6.70, I assume you are in the US, and get a second
' hand 2 meter for $100.00 or a new mobile/HT between $170-200. With the no-code
' Tech license it is easy to have family members study along with you and you all
' take the class together and you can use ham radio to keep in touch.
```

All in good time. I am using that money to buy a UPS for a new computer I've built. In the meantime, I have the "Now You're Talking!" book from Radio Shack (got it for free!) so that I can study for the tech license.

For those that are interested, I am in the Delaware Valley area in the United States.

As for family, I keep in touch with e-mail. For now. If I could reach out to SF in CA or Houston Tx by riding repeaters or by use of the appropriate frequencies, it would be cool to get some family members involved.

```

My PRO-94 uses the standard BNC type connector for the antenna. It
also has a 1/8" mono output jack. This makes it very easy to hook to
any type of antenna so that I could use the scanner mobile or in a
fixed base.

I'm in the middle of spending my money on other things right now, but
my next investments in this area will likely in HAM.

Mygosh ! I just did a search this a.m. after posting this ad and heard the sad news.
I haven't been on the scanner scene for a few years and didn't know much about news and such.

My conndolences to the family of Bill and everyone in the scanner groups.

He certainly helped me and I appreciate all the writings he took time to pass to the scanner groups.

Contacting the ISP's will eventually get the user booted but with the
advent of all the free services like NetZero and the like they just keep
floating. This has been going on for too many years. Kill filters are
the current best answer but even those last a very short time due to the
frequent changes in ISP's by the worst of the offenders. I currently
use about a dozen kill filters in this group and that keeps most of the
crap out.

It is a FACT, which you would realize if you had not just memorized the answers for your multiple choice tech ham license. I have an Extra, and a GROL commercial license. I also fly with 2 pilot friends and use 5 watt HTs on board all the time without any problems to flight instruments.

Source record: 82866
Cross-posted to: alt.radio.scanner,rec.radio.scanner

Some say the leaves will affect reception but they are probably
referring to a forest of many trees not just one. You probably can't
measure the difference of one tree but you know it will be better than
an indoor antenna!

Anyway try to get some parachute cord, the olive drab color, over the
highest limb you can with a weight on the end. Let this come down and
securely attach it to your antenna with coax attached. Now just hoist it
up and check out the reception.

I grew a tree (tried to grow 2 for stereo) on my patio for the express
porpose of hiding antennas inside. I have 2 Slinkys and a L400 LF active
antenna presently hidden in it.

Cross-posted to: alt.radio.scanner,rec.radio.scanner

The problem could lie in the leaves, especially if you're monitoring 800-band, or in the cable...or both. The higher the frequencies you're trying to receive, the more they tend to be affected by these things. Be sure you use good, new, cable and don't run it any farther than you absolutely need to.

There's an antenna out that's made for your type of situation called the "Ventenna." I haven't used one, but the idea is interesting. They have a website at, of course, http://www.ventenna.com .

There were a coupl posts on the "strongsignals.net" site a while back, which I'll paste below. I've used antennas in my attic with very satisfactory results, by the way.

In Reply to: Ventenna Antenna posted by T.R.R. on April 16, 2000 at 23:13:13:

Hello !
My understanding is that there is only one Ventenna designed specifically for scanners..the other one is for 2-meter ham operation.Altho' I do not own one, I read a review of this antenna some time ago in MONITORING TIMES magazine as I was thinking of getting one myself.The article stated that this antenna performed well in the VHF hi-band, but was marginal in everything else above or below this freq range.The reason was stated as the LENGTH of the Ventenna being cut so closely to the optimum antenna length for the VHF hi- band !The review was not too favorable and discouraged me from buying one myself. HOWEVER, it also stated (and made sense...) that this antenna is better than nothing if you live in an area restricting antenna erection due to zoning or whatever, and will increase the performance of your scanner somewhat.Heck..ANY outdoor antenna up high will help somehow, and if you cannot put something up because of finicky

neighbors or landlords, it still might be worth considering. But, if you DO have an option to put up something else, I'd suggest considering something else. There are a LOT of excellent base scanner antennas around, but sadly, few that are "camoflauged" as well as the Ventenna. Good luck on your project and selection !

: If your roof is wood with asphalt shingles, mount a good antenna in the attick. This is where all of my antennas are and they work great.

"DH" <dh@crewcompany.com> wrote in message news:ZLFj5.15$mo.10585@news.uswest.net...
I have put my antenna (I got it from a friend so I don't even know what kind it is--long with 3 smaller pieces near the bottom in a triangular pattern sticking out from the main pole) along the trunk of a tree as my Homeowner's Association does not allow these types of antennas.

Because of having to "hide" the antenna, I am wondering if the leaves will affect my reception. I do get some police transmissions, but not as many as I would expect (I live in the Phoenix area).

If the leaves do affect it, would I be better off with it on the ground, hidden by my wall? What have others done with a similar situation?

Thank you for your help.

<sjacobs@mailco.net> wrote:

>No consumer grade equipment has the ability to affect any equipment aboard any
>aircraft.

Your statement is incorrect. Consumer grade equipment is certified
under FCC part 15, for RF interference. Part 15 is all about
interference mitigation and limitation --it does not guarantee that
any given device will not interfere with other licensed services. It
merely limits the potential for interference.

That interference can still be substantial, despite testing and
certification. Further, part 15 is all about *design* certification.
It does not *prevent* unintentional radiation from any given unit.

So contrary to your assertions, there really have been cases of
aircraft going off course due to portable electronic devices. For an
example see
http://asrs.arc.nasa.gov/callback_issues/cb_201.htm

>> And speaking of law, the captain of the plane, command pilot, pilot in
>> charge, whatever term you wish to use, has the final say on the usage of
>> any, repeat, ANY consumer electronics on board a commercial flight. His
>> word is LAW.
>
>No one disputes this, NOR does it even closely relate to the issue that
>cellphones do not interfere with any navigation equipment, only the cellular
>system.

Forget cell-phones for a minute: The citations provided by Mark, Dan
Larson, and others were quite appropriate. These laws apply to ALL
portable electronic devices you might carry aboard an aircraft.

Would a cell phone cause interference to an airliner's navigation
systems? Not likely --but likely or not, there is no guarantee. In
any case, how do you know the phone is working as well as it did in
the factory? How would you *prove* the phone is safe? Let's face
facts: anything unnecessary operating in an aircraft while it's on an
instrument approach is unwanted. Would you take the chance that
everybody's cell phone is working as designed while screaming toward
the runway at 180 knots on a dark, foggy night?

If you really think you are right about this issue, go get yourself a
private pilot certificate, buy your own airplane and then you can use
whatever you want to your heart's desire. Until then, live by the

rules everybody else does. The FAA doesn't hand out exceptions just
because you think you know something.

>You should know better having a Tech Ham License, but then again, if you did,
>you wouldn't be posting your call sign on a newsgroup so everyone knows your
>home address. Not a very wise thing to do nowadays on a newsgroup.

>Cancer Suit Filed Against Telecoms
<snip>

Sigh. And the worst of it is that he has friends who will testify that the damage to his brain was exactly the area closest to the antenna from his cell phone. Not one of them is an electrical engineer, however. Little do they know what happens to radiation when it enters human tissue (for that matter, no reliable models exist that show what happens to the RF when it is radiated so close to the brain).

The problem is the term "radiation." Most people associate it with nuclear energy. If only we could get the media to use the term "propagation." Then nobody would have any idea what we're talking about. Who knows, they might think we're talking about sex ;-)

The bright side? I hope the CTIA spends millions defending this case. And I hope they win after a long long battle. Meanwhile we can only hope they take less notice of the scanning community.

That is only YOUR perverted opinion.

> in your opinion, the evils of Bill Cheek. In reality, your

MANY people feel Bill presented an evil presence online. This was
confirmed by him being kicked off his ISP (San Diego RoadRunner) for
abuse & being kicked off the Scan-L Mailing list by Peter Laws.

> At first, you started with FidoNet and Bill Cheek. When you
> attempted to disrupt and antagonize the scanner forum with your
> rude and abusive antics, you were admonished by Cheek to behave
> or face exile from the forum. Instead, you continued your nonsense

I simply disagreed with him on a topic, for which he banished me. At that
time,
Cheek was kicking about 5 people off the echo every week. He was kicking
people off who were more technically knowledgable than he or those that
he could not control & manipulate (in other words, all the GOOD people).
Fools like Blake B were the only ones left. Cheek actually honored me
by kicking me off.

> and subsequently were banished. Angered by Cheek's banishment, you

I was not angered, Cheek acutally honored me with his actions.

> followed him to the Internet where you continued to stalk and attack him.

I have never stalked anyone. However, when I arrived on this
rec.radio.scanner,
I found an all out WAR against Cheek. I simply stated my opinions on Cheek
& acted as a witness regarding his actions.

> Cheek defended himself from your attacks in the same manner and
> vocabulary that you attacked him. You couldn't intimidate him or
> your most vocal critics and resorted to rogue cancellations of

I never attacked Cheek. However, I have held him accountable
for his actions as would be done for any adult.

> their public condemnations of your actions. This cost you the
> loss of your account with your ISP Sprint. With a new account,

I have never lost an account with any ISP, including Sprint.

> It has been well established that you are a liar and a fraud whose

Please present your verifiable proof that I am a liar or be found to be a liar
YOURSELF, by default.

> Literally dozens of people have also asked you in their
> own way to cease your bad behavior.

Actually it is the other way around. Go read the message from Larry Johnson,
he is complaining about YOU, & talking about complaining to YOUR ISP of Primenet, NOT ME!!!

> demonstration of your sociopathic personality.

Please present your verifiable qualifications to make an assessment of mental issues.

> Responsible backbone Internet providers have a method of dealing

That is not true. MANY people have posted messages supporting me
on this NG. You are the one who gets messages of people talking about
complaining to your ISP. (see the mess from Larry Johnson!!!)

> Reposting one of your diatribes from one of your fictitious personas
> blasting Cheek doesn't count.

I don't have any "fictitious personas", but I can repost messages from
otyher verifiable users. Would you like to see a few posts?

> Speaking of proof, where's the proof of your claim to have a "Masters
> of Communication Technology"?

As I have stated before, I will post my education data as soon as Cheek's is
posted. People were asking for his LONG before anyone asked about mine.

> Cheek was a real person, a loser, a liar, and a fraud.

Well said, very well said!

> Cheek had real technical ability, you have none. Zero. Nada.

No, Cheek proved he had NONE of that when he suggested using a mettalic
screwdriver to adjust a RF coil!

It is rather clear to me that Fred doesn't know what the heck he's talking about. Perhaps it's sheer ignorance, perhaps he doesn't have the correct Fleet Map programmed, & thus he's only hearing what he's reported. Either way, he's wrong.

There's good stuff on the DPD trunked system, and anyone within range can easily verify this by just scanning the freqs, even if you can't trunk-track them.

2787. Antenna in Tree (hidden from HOA) - do leaves interfere with reception?

Newsgroup: rec.radio.scanner
Date: 2000-08-07 00:00:00 UTC
From: DH <dh@crewcompany.com>
Message-ID: <ZLFj5.15$mo.10585@news.uswest.net>
Source record: 82935
Cross-posted to: alt.radio.scanner,rec.radio.scanner

I have put my antenna (I got it from a friend so I don't even know what kind it is--long with 3 smaller pieces near the bottom in a triangular pattern sticking out from the main pole) along the trunk of a tree as my Homeowner's Association does not allow these types of antennas.

Because of having to "hide" the antenna, I am wondering if the leaves will affect my reception. I do get some police transmissions, but not as many as I would expect (I live in the Phoenix area).

If the leaves do affect it, would I be better off with it on the ground, hidden by my wall? What have others done with a similar situation?

Thank you for your help.

2788. FS: RS PRO-90, PRO-2050.

Newsgroup: rec.radio.scanner

: antennas.

Sounds to me like what the CB folks used to call a "Stargrazer".
Probably tuned for CB reception, but without knowing more about it, I
wouldn't trust that guess.

: Because of having to "hide" the antenna, I am wondering if the leaves

First, a small rant, since you touch on a very VERY sore point for me.
Indulge me my whim, if you would...

My first, gut-instinct response is tell the HOA to go screw themselves
and hang it on a proper mast, out in the clear. Whose property is it,
Hmm? Yours or theirs? Having lived in the Phoenix area myself, I know
that the HOAs have WAY too much control. Red tile roofs on identical,
shitty-looking, sand-colored faux-spanish architecture for as far as the
eye can see, and god forbid someone paint their place a different color,
or try to irrigate an "unapproved" tree into surviving...

But then, I've never been able to stand subdivisions, or the mentality
of someone who would live in one. Even less the mentality of any
american who would accept some batch of pinheads telling 'im what he
can/can't do on his own property in the name of some homeowner's
association...

Do they approve your toilet-paper purchase for you, too?

End of rant...

: will
: affect my reception. I do get some police transmissions, but not as many
: as I would expect (I live in the Phoenix area).

When I was scanning (from the southwest corner of Jomax and Scottsdale
roads) I used a discone on a 20 foot mast. The traffic was pretty sparse
on the cop channels. Most (99.99%) of what I heard in the band one would
expect to find police chatter was mundane stuff. The most "exciting"
calls were for officer X to contact central on the cell phone. I finally
pretty well gave up on listening to them, instead, listening to the

contractors putting up the new subdivisions. There was much more life there. Whether that's because I was so far out of the center of town, the mountains were in the way, Phoenix PD had gone trunked, or some combination of all of those, I can't say. All I know for sure is that for a town as big as Phoenix, the cops were surprisingly quiet. Heck, even the taxicabs were moving to the equivalent of an MDT!

: If the leaves do affect it, would I be better off with it on the ground,
: hidden by my wall? What have others done with a similar situation?

If they have moved into the 800 range, leaves can mess with that band.

One fellow I talked to while there had gotten around his HOA by building a little mount plate for a rubber-duck, and sticking it to the peak of his roof, then running a line from that to the scanner. Hardly the best choice in the world, but it got him around his subdivision's idiotic restrictions.

As usual, John snipped out the part that makes him look bad. (the part where I asked him to repost a previous on-topic post.) He didn't do it. Perhaps he couldn't.
I'll admit, it would have been time consuming looking through all those posts.
Then he follows it up with one of his juvenile come-backs like " stop talking about yourself " or " It sounds like you should follow your own advice" Or in this case . " I do compliment you, admitting the problem is the first step towards fixing it."

Responding to him is the problem. I knew this a year or so ago, when I decided to not respond to him. I kept my vow for quite a while, better than a year. But then I blew it. Hopefully it won't happen again.
Bye John! Please feel free to impress us with another witty statement. You will get no response from me.
You are fooling no one!

I am sure that you don't consider profanity and threats over a repeater as "wrongful", demonstrated by your action on here the last 5 years. You have no morals, scruples or conscience. The 4 hams that listened to you and the one that talked to you know you did it. 3 have posted that you did, not one person has said "No, John-Corky Mackey wouldn't do that". Not even one of your PARG buddies. Why? They know the lowlife you are John-Corky Mackey. End of story.

> are concerns by the FAA and NTSB that low powered EF emmisions could bring down an
> aircraft, I think they would be screening these items
> out of you carry on baggage. They don't do this.

There are two separate issues here.

One: The FCC has banned cell phone use on aircraft in the sky, per the phone industry's request. This issue has nothing to do with aviation safety, nor the FAA.

Two: Scheduled airlines operate under Part 121 of the federal aviation administration's chapter of the CFR. A section in 121 states that passengers may not use devices which are not approved by the operator of the aircraft, and the operator has taken responsibility that the device will not cause interference to the aircraft systems. A non aviation approved transmitter has a non acceptable level of probability that it will cause interference to systems. Some of the systems are highly susceptible to interference, especially that navigation system. Anyone who understands how critical and sensitive the VHF navigation receivers are, and how a unwanted image on a frequency that they are using causes problems realizes this.

Airlines have determined that laptops do not cause problems with systems. Quite understandedly that they have not made this determination for transmitters, including cell phones. As for cellphones, it wouldn't matter if they did; refer to point one above.

As an addendum, there are many things that can bring down an aircraft that are not screened.

That's because the FAA doesn't care that much if you go out and care yourself.
But once you take somebody's money and take them or their property in the sky,
you bet they suddenly care a whole lot more.

You can use a non certified GPS while in flight. But you can't use it say, for
a primarly means of IFR navigation. Laptops are not certified either.

> Why is that so hard to understand?

> word is LAW. That is FAA rules, and also the rules in many other countries.

That's not quite what the law says. Here, the context is scheduled airlines,
which operate under Part 121 in the regulations. To be sure, operators are not
pilots in command. Let's take a look:

(a) Except as provided in paragraph (b) of this section, no person may
operate, nor may any operator or pilot in command of an aircraft allow the
operation of, any portable electronic device on any U.S.-registered civil
aircraft operating under this part.
(b) Paragraph (a) of this section does not apply to--
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the part 119 certificate
holder has determined will not cause interference with the navigation or

communication system of the aircraft on which it is to be used.
(c) The determination required by paragraph (b)(5) of this section shall be made by that part 119 certificate holder operating the particular device to be used.
---
(2) "Commercial operator" means a person, other than an air carrier, who conducts operations in air commerce carrying persons or property for compensation or hire.

Mike:

I can't recall if the BC200 has a CPU reset button somewhere on it? If so,
have you tried that? Usually it's a very small hole that you carefully
insert a paperclip wire, or similar device, and push on a tiny button.
Sometimes they're in the battery compartment. Be advised, doing so will
wipe out all your programming.

Man, there's a bunch in the clear on C-band.
It wouldn't be pratical to schedule watching them because they are both
erratic and just a shot here and there.

>
> Some old satellite 2 GHz TVRO receivers with the big dishes (The older
> ones - the newer ones fell under the EPCA.)

Many of the newer ones have the ability to monitor at least some of the
subbands without having to hook to a jack out the back.
had a subcarrier output jack

Pretty much not much, without a bit of cut and try.
BTW, if you want one of the older setups, and add in the local paper can
quite often get you a complete set up for $100 or less. Some are available
for the removal.

>
> Some cable systems have strange subcarrier stuff running around too.
>
I kept my C-band because I qualified for the networks through grandfathering

but they won't let me take that to a Ku band setup, such as the Dish, or any other DSS system.

Usually I can find a station that "doesn't" have football, basketball, baseball, or championship wresteling.

I'm not much of a "spectator sports" fan. <:-))

It always amazes me that people seem to think that a willingness to identify
yourself and stand behind your statements is bad. My word is my bond, I'm
proud of my name, and I'm proud of my license. I've worked hard to acquire
my knowledge of electronics over the past 35 years. I don't pretend to know
it all, and I don't make blanket statements. As for them knowing my home
address, what is going to happen? Are you going to come hunt me down? I've
got a trashcan for junk mail, that's not a problem. And an answering
machine to screen calls.

2819. COmmtel TWR full coverage receiver

Newsgroup: rec.radio.scanner
Date: 2000-08-07 00:00:00 UTC
From: mp <mplanck@my-deja.com>
Message-ID: <8mlhblcir1@nnrp1.deja.com>
Source record: 82974
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Hello!

I am trying to add a HOLD feature to a Commtel TWR-850. It is not a typical 'scanner' since it does not have any channels or a frequency display (Just an LED signal strenth meter). I would describe it as a Poor Man's Xplorer or R11 (Devices sold by www.optoelectronics.com). In fact it is often sold as a bug detector. It simply scans through a large frequency range and stops at the strongest signal. The problem is that there is no way to hold it on that signal, to catch a delayed reply or to simply prevent the radio from moving on if the signal momentarily drops below the squelch threshold. Turning the squelch all the way down just won't do it.

I tried emailing various overseas scanner retailers like the CBshop in the Netherlands, Javiation, Bandercom, etc...(since they used to sell the Commtel TWR-850) but none of them have any ideas on how to do this modification or how to get a service manual for this radio.

There is no FCC ID on the radio so I can't even determine who built it. (It was NOT GRE, I checked with GRE usa and GRE Japan and they both said that the had never seen that radio before). I also tried emailing Altai which is the European distributor for Commtel with negative results.

So if you:

1) Know how to add a 'hold' feature to this radio,
2) Know anything about the workings of the TWR-850,
3) Know who the original equipment manufacturer of this radio is, or
4) Know how to get a schematic or service manual for this radio,

PLEASE EMAIL ME!!!

Thanks for any help you can provide!!

It is possible to operate flights under Part 91 where passengers exchange
money with the pilot in exchange for flight. You can show up to my
airplane, pay me half of the operating costs of that flight, take off
under said conditions, and we'll be quite legal. Correct me if I'm wrong,
but that situation fits your scenario :)

Sounds like you may have a control channel missing or locked out. I couldn't get mine to display any IDs on the EDACS system. I put in it manual and looked at every channel. WHADDAYAKNOW! The control channel was locked out. I unlocked it and it displayed all the group IDs.

If you can find a used PRO-26, it would be the best one for MilAir comms. It will automatically store each frequency it finds, plus, it will search at 300 steps per second when you set it to search in 5 kHz steps. When set this way, it will search through all the freqs faster than it does using the default setting of 12.5 kHz steps or even setting it to 25kHz steps. You need to search this particular band as quickly as you can, as it extends over a 175 mHz range! I only wish it had a 100 kHz step setting, as most MilAir comms end with .100, .200, etc.

Is the Pro 92 made by Uniden, if not by who?
How serious are the problems with the 92? Would the firmware upgrade
available for it be a fix?

I have also heard the Pro92A also has problems. How does it compare with
the 92? Would the 92 with firmware upgrade be better then the 92A??

Would you recomend another brand or model HH scanner instead of the 92/92a??

Thanks in advance!
Jim

The definition fo "nonacceptable" being amazing low
in this case however.

> Some of the systems are
> highly susceptible to interference, especially that navigation
system. Anyone who
> understands how critical and sensitive the VHF navigation receivers
are, and how a

realizes this.

Yes, but we also realize that if there was any real
credible threat, the systems would be hardened to address the
problem. They are not because there is not.

>
> Airlines have determined that laptops do not cause problems with
systems. Quite
> understandedly that they have not made this determination for
transmitters, including

But this is the crucial point of the subthread. They
are prohibited because of the FCC. Without that, the FAA would
have little proof of risk.

>
> As an addendum, there are many things that can bring down an aircraft
that are not

> screened.

In this case, they are not particularly concerned because
the credibility of the threat is weak, very weak. If there was
any real risk to the aircraft, the aircraft systems would be
hardened to deal with it.

Jim:

The PRO-92 is manufactured by GRE, for Radio Shack. The PRO-92 had some issues, how much of a problem seems to depend on where, and how, you use it. I have one, and in Warren, Michigan, I don't have the problems others talk about.

The jury is still out on the PRO-92A. It appears that although they fixed some of the problems the earlier model had, the newer one, has newer problems. Someone indicated that the earlier model can be upgraded to the newer firmware, by replacing the circuit board, but there will be a cost involved.

The PRO-92 programs, and operates, quite differently from previous scanners, both GRE, and Uniden. And there are even differences between the early, and later models, in how they're programs, and operated. Maybe when we take time to RTFM (read the fine manual), it won't be as bad as we initially thought.

Message-ID: <OHAj5.20986$k5.208045@news1.rdc1.mb.home.com>
Source record: 82994

A very broad question; however there's several techniques you could use.

1. Try to get a look at the radio's themselves. Are they trunked? A clue to this is a beep that occurs a second or two later after the user keys the radio to let them know when to speak. You would then need to have a trunking scanner and know the local freqs/talkgroups for this. Non-trunked radios may also yield some clues; is there a frequency display? If so, some friendly conversation with one of the users may yield the answer you need; let them know you are interested in radios (perhaps don't mention the scanner aspect) and see if you can get a look. Sometimes the freqs are written on the radios with dymo-tape etc, or engraved on the back.

2. Find out who the owner/operator of the condominium complex is; the proper company name. Then, consult one of the FCC search index sites (such as percon.com) for your area and see if you get a hit (will not apply to trunking radios).

3. Hit and miss; use the search features of your radio. Admittedly this is the most difficult, especially when the radio users don't key up much. You can plan out your searchs to be more efficient if you do this in "blocks". Don't bother searching freqs that belong to other things such as cordless phones, air freqs, ham bands etc. Stick to your small search zones for a period of time until you know you can rule them out. Try to monitor when there is something going on, or at known times of check-ins etc.

4. Check to see if there is any web-pages for your area; usually small time users such as condos don't make the big lists, but if they use trunked radios you may get an id you can use.

5. Those hand-held frequency counters sometimes work well for situations such as these; don't buy one unless you're a serious monitor as they're generally not cheap and give mixed results. Know anybody you can borrow one from?

I hope some of these ideas will help; I've used all of them at one time or another with some very producive results.

Good scanning!

zerg90@webtv.net (PS) writes:

' Are you sure that electrons have to be knocked off chromosones in order
' for damage to occur?

Well, the only other thing I can think of that will cause a chemical
change is cooking. That's a lot of localized heat. I don't think you
will get that from a cell phone.

If there is a problem with cell phones, then what about RF emited from
all the other electronics that suround you? What about your 900Mhz
cordless phone?

I just can't see it making a difference.

' If heating causes circulation increases, won't that cause faster growth
' of any tumors or cancer cells that exist?

If the cancer cells are already there and the body's immune system
isn't killing them, then you already have a problem.

Sounds like a ground plane.

> Because of having to "hide" the antenna, I am wondering if the leaves will

To some degree. Depends how many and how close. It will also change with the weather and the season. I have a quadrafiler antenna I use for VHF wx fax reception up in an enormous Black Walnut tree. It works fine. I would suspect that putting it in a lower attic surrounded by wood and composition roofing would be worse.

> If the leaves do affect it, would I be better off with it on the ground,
> hidden by my wall? What have others done with a similar situation?

I would suggest you pick a few local frequencies, such as NOAA wx for one, a few local police and fire. Maybe a UHF and a VHF ham repeater that is quite active. Try these freqs with the antenna on the ground before you put it up. Then compare after you raise it.

Height is really important for scanner reception. It will overcome may deficiencies.

Glenn

From: Tim Tyler <ttyler@mich.com>
Message-ID: <39907AB1.F2A32BAB@mich.com>
Source record: 82758

'Perfect Paul' is a synthesized voice. Pretty controversial with the public as well as within the National Weather Service. Much of the public & NWS staffers dislike it for obvious reasons, yet it has been/is being phased in nationwide because feeble-minded NWS/NOAA/DOC bigwigs bought it & mandated the migration to it.

The good news is that efforts are being made to improve intelligibility, and other than speech quality issues, it is a lot more efficient (especially during watches & warnings) than a local human being used.

Maybe, maybe not. Not that it makes any difference.

>few seam to know and even less care,it is illegal to intercept any
>common carrier unless you are an agent of the coampany [/ies] providing
>the service [for routine monitoring and control] or a member of the FCC.

Nope. Satellites reception is specifically allowed in title 18 as long
as the signal encoding is readily available to the public (definition
in the title).

Radio broadcasts have long been treated differently than wires, as any
casual perusal of title 18 will attest.

Please back up your claims with the relevent law. As I posted
previously, I haven't been able to find it, so your further repeating
of rumor is useless without facts to back it up.

PA. TURNPIKE UNITS
150-series are Ambulances 200-series are tow trucks
300-series are State Police 2000-series are highway maintenace

Police & Maint/Work Crews use same channels on.
PSP Troop T handles patrols on the turnpike. ALL Troop T dispatch
is done from Harrisburg. System is linked via microwave.

Pennsylvania Attorney General's Office

154.950 (F-1) -Drug Enforcement Mobile-to Mobile
155.445R/XXX.XXX (F-2) -Drug Enforcement Dispatch
155.490 (F-3) -Drug Enforcement Regional (CLEAN)
156.090 (F-4) -Drug Enforcement Special Operations
460.200/465.200 179.9 Department of Justice North Repeaters (F1)
460.475/465.475 179.9 Department of Justice South Repeaters (F2)

Use depends on if one of the channels has been assigned to local agencies.
Western PA is primarily 460.475

Pennsylvania State Police Liquor Control Board Detail>

158.7600R/156.0150 151.4 F-1 (Phone Patch Capable)
158.7600R/156.0150 123.0 F-2 (No Phone Patch)
453.1375R/458.1375 Harrisburg
45.3000 Simplex Portables (Old System)

Pennsylvania Emergency Management Agency (PEMA)

PEMA uses 5 channels:
453.525/458.525 Main Repeater
453.350/458.350 Mobile Repeater
453.525 Simplex
453.350 Simplex
158.835 VHF
45.300 (Old System)
PEMA uses DIFFERING CTCSS (PL) tones for various counties main
repeater as follows:

Allegheny Co. 210.7
Armstrong Co. 103.5
Carbon Co. 136.5
Clearfield Co. 179.9
Fayette Co. 118.8
Indiana Co. 136.5
Lawrence Co. 156.7
Washington Co. 156.7
Schuylkill Co. 210.7 rpt. tx 179.9 Input
Somerset Co. 136.5

PL is NOT used on 453.350 the mobile repeater or simplex.

169.425 PEMA Rain Gauges
169.500 PEMA Rain Gauges
169.525 PEMA Rain Gauges
170.275 PEMA Rain Gauges
171.025 PEMA Rain Gauges
171.085 PEMA Rain Gauges
171.125 PEMA Rain Gauges
171.850 PEMA Rain Gauges
171.875 PEMA Rain Gauges
412.625 PEMA Rain Gauges

Rain Gauges are scattered throughout the state, and transmit
data on the above
frequency back to the local EMA office. At that point it's
collected on a
computer using IFLOWS software, and relayed to PEMA HQ in HBG via
Ku band VSAT
satellite system.

PEMA also utilizes the Ku band satellite system known as SEVAN
to send
messages to local EMA offices regarding events around the state,
and weather
information from the NOAA Weather Wire.

SEVAN also provides for a voice channel to all EMA agencies,
and a video
channel from PEMA HQ.

Crossposting reduced to relevant areas..

Irrespective of the legality of monitoring subcarrier transmissions,
are they used in the UK ?. I'm aware of the 38Khz FM Stereo Pilot tone
but I've never heard of any other subcarrier usage over here.

> operation.

It was just a coincidence that the equipment returned to normal after "tape players" were turned off. What "tape player" has any sort of rf generating device in it? And don't even start with the miniature motor that runs off of 2 AA batteries. I can guarantee you the problem had nothing to do what-so-ever with the tape players! They show movies aboard planes you know? Pre-recorded movies on TAPE players.

> Air carrier aircraft are not the only ones susceptible to the effects of
> portable electronic equipment. Small aircraft, too, can experience
> interference with potentially serious results, particularly in IMC
> conditions.

Any one who flies aboard aircraft using 5 watt ham radio equipment can tell you that this is a bunch of bull. It amazes me that people really like to believe fairy tales like this, yet choose to believe that it is perfectly ok to put a microwave generating device like a cell phone next to one's head and that THAT does not cause any problems.

> Since I don't expect an Extra to admit he might be wrong, even when given
> evidence to the contrary, I'll just put you on my block sender file.

I have no problem admitting I am wrong, but that rarely happens. You know WHY? Because I don't make statements unless I know what I am talking about! If I am unsure of something, I don't make ANY statements on the matter. How are YOU on admitting you are wrong???

2868. A review of the "Super CC Gainer" antenna

Newsgroup: rec.radio.scanner
Date: 2000-08-08 00:00:00 UTC
From: Walker <worldvistaNOwoSPAM@altavista.com.invalid>
Message-ID: <0e329c19.1fe221e1@usw-ex0101-005.remarq.com>
Source record: 82773

Hi All,

I recently tested the CCrane Co. (www.ccrane.com) Super CCGainer mobile scanner antenna (Item CG2). Cost $29.95 (shipping included).

For mobile use, this antenna cannot be beat. It will far exceed the performance of the standard rubber duckie scanner antenna on all bands, including 800 MHz.

However, if you use your mobile scanner primarily as a base unit like I do, the Radio Shack Telescoping Scanner Antenna (Cat# 20-006A) outperforms it by a good margin (but is CONSIDERABLY longer and bulkier). The difference is not enormous, but noticeable enough (3-5 dB?) on *all bands* that I would recommend you spring for the Radio Shack antenna at $9.95 (and maybe a GRE Super Amplifier), rather than spending 3 times more for the Super CCgainer mobile whip antenna.

Both antennas perform much better with a good ground. Attach a ground wire to the base of the antenna (the knurled portion that attaches to the scanner) and the other end to the best ground connection you can find. Of course, this applies mainly to base station usage.

W.

Look past the ego, and you will see,
what dwells within is God, not "me."

Each cell site has receivers. A cell phone transmitting at high altitudes in an airplane will be received by hundreds more cell sites than on the ground. The cell sites have to determine which site the cell phone is closer to. This is nearly impossible under this situation, especially since the system was not designed for a situation like this as it would not occur on the ground.

> Another "God-complex" Extra.

Quite the opposite, only mentioned it since you were under the impression I had no background to be qualified to know what I am talking about. I am actually one of the few Extras that is against the code requirement. As a matter of fact, I have never once used code on the air at all, I prefer to use a microphone and don't understand why I had to learn code in order to get a license to TALK below 6 meters. I didn't have to learn how to drive a Horse Surrey to get my automobile drivers license.

> You sound like a guy I know who drinks 5-6
> double scotchs at happy hour and drives home.

I don't know what that means, but I rarely ever drink, perhaps a tasty cocktail 2 or 3 times a year.

> Never had any problems, so it
> must be alright. Just because you haven't had any problems doesn't mean
> they can't happen.

That's not how I judge it. Technically and Physically it can not happen, the fact that it has never happened to me is just more repeated evidence to back up that fact.

> Here is the report mentioned earlier from the NASA website.

NASA is part of the government. The same government that tried prohibition once and did not learn from it and did it again, and back come all the gangs and crime we had during the first prohibition. NASA told us that there could be no other life on other planets, and that Mars was a red hot planet with no water, the story changes often. Government makes laws and restricts freedom, they need to change science to their own propaganda to fit their goals. Cigarettes are more harmful than Marijuana, yet which one is legal and which one is outlawed?

I have an Icom R7000 also. It isn't a scanner it is a uhf/vhf receiver. With software you can greatly increase this receivers scan speed. It's still not a scanner.

Cellular phones, often called Cellphones in the US and Handy's in Germany, are a particular source of
problems because, regardless of whether they may interfere with aircraft systems, the technology on which
cellular telephones are based precludes their effective use on aircraft. This applies to all cellular phones,
including the analogue technology in the US and the digital GSM technology in Europe. It may be worthwhile
first to explain the known problems associated with attempted use of cellular phones while flying.

The technology of cellular phones is based on small local ground-based reception areas called `cells'. A
cellphone user is served by just one cell, and when reaching the boundary of a cell, will be `handed over' to
another cell which (s)he is about to enter. The topology of coverage is based on the assumption that the user is
on or near the ground, and it is a technical assumption on which the entire system is based that a user will be
within `sight' of just one cell except when nearing a cell boundary. When in an aircraft, however, a user is within
radio `sight' of many cells, simply because (s)he is way off the ground. An attempted call or reception from an
aircraft would activate many if not all cells in the local area, which `breaks' the technology -- it causes many
transmission problems and the system is disturbed. Therefore the various communication authorities, such as
the US Federal Communications Commission (FCC), ban the attempted use of cellular phones while on board
aircraft. However, such attempted use is not ipso facto rendered dangerous. It is technically inappropriate and
antisocial, as well as mostly futile.

I know that smoking takes about 20 or 30 years to cause major health problems. Anyone that claims to have proven that cell phones are safe must have been doing some serious time travelling.

(I see the word "nuts" has already come up in this thread).

Can someone explain where the ANSI and FCC RF exposure standards came from?

I know that I lot of people are going to make smart remarqs towards me on this message board for this. They always do. But I have a list of cordless phone frequencies. I picked up my neigbors cordless phone on the base frequency 46.765 and the handset on 49.835. Those frequencies are not on my list. So if anyone has a list of cordless phone frequencies w/ these frequencies could you tell them to me or tell me where I can get them . Because I would like to have all the frequencies of the channels on that phone it possible. Thanks, Sam alphacentauri@i-plus.net

The way I see it is that at high freqs, leaves act as rf reflectors.
Instead of absorbing energy, the reflect it like little parabolic antennas.

It kinda makes sense, if your match is close on TX, it would be on RX as
well if your on the same freq.

>permission. In the case of SCA specific language was applied.

I think you are wrong. I've read a lot of law and bills related to
stuff like this, and found nothing. Many people have long believed
that receiving SCA was illegal (Muzak folks spread that rumor for
years) but it never has been unless things have change in the last few
years. If it has changed, post it. The current USCode on cornell
doesn't make it illegal:

http://www4.law.cornell.edu/uscode/18/2511.html

>Someone posted a paragraph earlier in this thread, maybe you can
>find it.

I can't find a reference either on my news server nor on Deja. I do
find lots of places where you claim it is illegal, but no cite. The
closest was an old thread from last March containing a quote from title
18, but even that quote specifically is about satellite transmissions,
and says it is OK, "unless the conduct is for the purposes of direct or
indirect commercial advantage or private financial gain."

> I also own the ART/Sci series of technical manuals delineating,
>among others, cell restoration mods for various receivers. Published
>in 98, it's clearly in violation of ECPA, and yet, it shows up all

That is not illegal either. FCC regulations make it impossible to
import or approve receivers of cell frequencies, but publishing
information about how to build them, owning such receivers and even
using them is not illegal. It is illegal to disclose what you hear...

> Of course there are those who will argue to the contrary. They
>are entitled to be wrong.

As are you.

>> The source of most of the "it is illegal" rumors are typically the
>> service or equipment providers who don't want consumers listening
>> for free. While it is illegal to play music or other copyrighted
>> works in public without paying royalties, such is not the case for

> Yes, that's what Napster said, too.

Not hardly. They claim to not be performing. And so far, they are
correct. Or hadn't you heard "innocent until proven guilty"?

> SCA is not a matter of royalty, but in many cases, of
>subscription. Of the stations that I have worked carrying SCA

Doesn't matter. I have yet to see a law enforce subscriptions of "in
the clear transmissions" unless you try to make a profit from it.

>transmissions, several carried telemetry between the transmitter and
>the studio on their SCA subcarriers. Unauthorized monitoring of this
>is illegal, as it is priveleged information. Usually digitally

Again irrelevent. The law forbids disclosure and profiting but
not monitoring. Unless you have some new information...

>encoded, which is clearly specified as protected from unauthorized
>monitoring under the law.

What law? Where are you getting all this crap? (Even if it is law, it
is still crap.)

> Of the stations not carrying telemetry on their SCA, several
>stations used their subcarriers to provide programming services.

Yup.

>Physicians Radio Network was one. Assorted music services,
>datacasts, weather services were examples of others. These were by
>subscription only. Unauthorized use of any kind, even person use, is
>theft of service. Again rarely prosecuted. But specifically illegal.

Not hardly. The service isn't in the signal. The service is in use of
the information IN BUSINESS. Personal monitoring is NOT USE.

>> Are you affiliated with said providers, or just repeating rumours?

> Nice shot...but neither. I work with the carriers who apply the
>SCA to their signals, and specifically, monitor, and measure, SCA
>transmissions on them.

Sounds like you are part of the party to me. In any case, without the
law you are just repeating rumors. Perhaps your carrierx try to sell
such services by claiming they are legally private... But they aren't.

A friends daughter works in a laboratory where they are studying the effect of
weak [on the order of the eaths natural magnetic filed] AC/pulsating DC/and
RF. None of the PHD types there will use a cell/cordless/HT anymore. She says
that very weak AC fields will do wierd things to palnt and animal growth.
Several years ago another friends wife was working on a study mapping out
different types of cancer. There where diffinet geographic patterns.
Proximity to hightension [60Hz AC here in the USA], closeness to UHF TV
stations and nearness to powerfull ATC radars. She also had some data
sugesting that poeple who work in 60Hz magnetic fields [like power plants],
and those who work around variable AC [train engineers] had very high cancer.
And then there was the data showing that polic who routinely operate X and Ku
band traffic radars had very high cancer.

They moved, so I have no idea just what happened to that study.
On a personal note I just keep my head out of microwave ovens(G).

It's obvious that you intend to dismiss based on my involvement in
the industry. So resolution and understanding is not going to
happen. I'll leave you to your confidence in that case, with this
caveat,...SCA transmissions are't "in the clear," by definition, and
subscription services monitored without a subscription agreement is
theft of service, by definition. That's business, or personal use.
Subscription is subscription, the right to listen is sold...to
listen to a subscription service, even in the privacy of your own
home, is still theft of service.

But, by all means, you be comfortable.

Thanks all for the replies--I checked out the 20-176 and I think I'll
pick one up. It'll fit quite easily in an attic.

I have to ask--why do you feel 15 feet of quality RG-58 would be a "bad
thing"? We're only talking 162MHz here. And I know it's a receive-only
setup, but do you really feel a 75 ohm cable is preferable in this
(presumably) 50 ohm application?

Curious,
Carl Van Camp

Hi, We have a NOAA weather radio; Radio Shack 7ch. Cat # 12- 250 Specific Area Alert at work. Nobody knows where the manual is for it. Can any of you out there help me find the directions or the codes and programming sequence for Webster and Hamilton County Iowa??? You have our thank in advance.....Sniper

PS please email sniperosok@hotmail.com

It applies to both transmitting and receiving...

Attach an antenna to a tuner and tune for best reception - you'll hear the signal increase in strength until you reach a point where no further adjustments help. At this point, if you put an SWR meter in line with the antenna and apply power you'll find the SWR meter shows the lowest possible SWR for that particular antenna/tuner/frequency combination. Change one of the components and you'll see the SWR increase with a resulting decrease in signal strength from the previous optimum (lowest SWR) point.

Simply put - the lower the SWR for any given antenna at any given frequency = best signal.

This is a rather simplified explanation for a rather complex subject, but I hope it helps.

John

This is a very good question. It seems that most scanning/digital receivers will go from 25 or 29 mhz to 50 or 54 mhz (with modification / option planned for when it was made it can go to 66 or 88 mhz for european service), sometimes even the whole segment to 174 mhz (Pro2006 scanner). Then we have the void from 174 to 220 mhz (pro mike area) and 220 to 240 mhz exists and another void to around 380 mhz (if my memory is accurate), where it resumes to around 520 mhz. I think there are some full coverage .5 to 1300 mhz scanners which may have that one available,

Aww shucks, for every study you cite, I'll show you another one that
debunks what the first one said. Moreover, some of the most damning
research has also been shown to have been "cooked." See the case
against Dr. Liburdy of Stanford.

Did you know how much a police traffic radar puts out? Milliwatts.
That's right, *Milli*-watts. You'd probably get more exposure to
thermal radiation by sitting on a hot car seat.

And further, the data showing higher rates of cancer for those who
work on telephone or power poles is not consistent. There are lots of
other environmental issues to consider. For example, have you ever
heard of "ickypic?" It's a water proofing gel used on outside cable.
It's designed to be mildly poisonous to rats and mice too. Now, are
the cancers coming from that? How would you know the difference?

And in fact, NOBODY has shown repeatable evidence in the lab
demonstrating any connection between any form of EMF and cellular
mutation. Besides thermal considerations, nobody has been able to
show anything repeatable in the lab.

So I have to ask where the real evidence is. Note also that some of
these so called "scientists" have no idea how to measure an RF field
and they have no idea how to calculate exposure accurately. This has
been the case even with well cited studies such as the Wertheimer and
Leper study. They ASSUMED that the EMF from power lines was
proportional to the classification. But it isn't. Later studies
which attempted to repeat their work failed because their assumption

was wrong.

Yes, keep your head out of the microwave oven. Yes, do take care to stay below the ANSI limits. But as long as that's the case, you have nothing to fear. I think the scientists who are looking for this EMF bogeyman are wasting their time. But nobody really wants to hear what an electrical engineer thinks about this subject...

The PCR-100 is similar, but Icoms software is better than that they
offer for the '1000. The big disadavantage of the '100 is the lack of
USB/LSB/CW/DSP. The advantage is FM stereo. And the '100 is at least
$100(USA) cheaper than the '1000.

Sorry, but that won't help, either. Gases evolved from adhesives,
manufactured construction materials, carpet pads, and other
synthetics, that build up in unventilated houses have been proven to
cause liver and pancreatic cancer.

Damned if you do; f*cked if you don't.

Subcarriers are "common carrier" like the wired telephone/telegraph [do they even still exist] and commercial satellites. While very few seam to know and even less care,it is illegal to intercept any common carrier unless you are an agent of the coampany [/ies] providing the service [for routine monitoring and control] or a member of the FCC.

I really don't know much about line matching, but isn't matching more important for transmission.
I use 75ohm's low-loss KTV cable 1.0/4.8CV, 14,6dB/100m loss @ 500MHz instead of RG58's 44dB.
And I find it great for reception, and best of all - the cable is very cheap...

I wrote but Corky in his usual style snipped........

>>Not a word saying you have any technical expertise, John-Corky. You don't
>>and your only defense is in that John-Corky drunken gap tooth slurred
babble
>>"Well Cheek proved he had none" bawahahahahahahaha! Still has Cheek 10
>>times more rf/radio savvy than John-Corky Mackey, originator of the saying
"
>>Duh, well I didn't know I should check polarity before installing a
>>repeater. Duh". That's Smoking John-Corky for ya!

K S 0 F begins his first lie with.........
> My technical knowledge was not in question.

Yes it was, I reposted the part you snipped out above Corky. Many others
have questioned

> Neither was yours or anyone
> elses.

Only yours because you don't have any.

> My multiple FCC licenses,

Like more ham licenses than you can count on one hand? HAHAHAHAHAHA! That
lie was revealed a long time ago.

> along with degrees

A degree in what John-Corky? You only education is Bed=Pan certification at
a technical school.

>and military experience

Being dishonorably discharged doesn't count.

> clearly indicate my high abilities of technical knowledge.

Smoking power supplies because you don't know how to check polarity and
ruining a repeater for the same reason clearly indicates your technical
expertise. Deny that.

Life goes on.....

Have you looked at the Icom PCR100.
IT is cheaper, abut 320US, I think.
A good radio, that for most folks should work great.
As contrasted to the PCR1000, the main drawback for me is the
lack of USB/LSB/CW and the fact that the PCR1000 will support an
internal DPS module. The PCR100 does have FM stereo.
And Icom's software for the '100 is better than that offered
for the '1000.

The hell with EMI cancer with an electric blanket, I nearly died under one
about 12 years ago. Sometime late at night I was awakened by my crazy calico
cat. She was making noises that convinced me she had finaly gone around the
bend. That, coupled with her wacking my face lead me to grab her firmly around
the neck, so as to be able to "solve" here craziness once and for all, and
as I sat up, I notice a strange glow at the foot of the bed.
I dropped [ok threw] her to the floor and jumped out of bed. I then noticed
the smell of overheated something. I looked close and saw that the blanket was
on fire, ever so small but still a flame. I grabbed the blanket and threw it
out the back door. Got another blanket [non-electric] and cover my still
sleeping wife up. Got a glass of water and extinguished the now not so small
flaming
blanket.
And my crazy cat slinked back up into bed and crawled under the covers and
shivered the rest of that night. And before anyone screams cruel and abuse of
animals, just you wake up with a yowling cat, scratching your face and remain
calm. And yes there was a smoke alarm in the bedroom, a combi optical and
ion unit. And I took it back and screamed at the electric supply house that
sold it to me. IT was revealed that that lot had been recalled!

We now have a water bed, even warmer, and I would love to see it catch on
fire!

2925. Trunk Tracking scanner wanted

> ones in?

One of my old radios is a BC-145XL, almost identical to the 147. You
can't do a search with it. You have to know the frequency in advance.
Most scanners today, except the very basic models like the 145 and 147,
have a search function, and it really comes in handy for finding
unpublished frequencies, or determining which frequencies have a decent
amount of traffic to listen to.

However, I do like my BC-145XL as a *second* radio. The audio quality is
excellent, it's simple to use and it can run from DC power in your car
(where legal).

> I'm in a northwest suburb of Chicago, near Pauwaukee airport. The Wheeling
> and Buffalo Grove police, fire, etc should be in range, maybe a few other
> 'burbs. I don't know what else this kind of scanner could potentially
> pick up. Any ideas?

You won't be able to hear aircraft since the radio does not cover that
band (108-136 MHz). However you can hear police, fire, businesses,
public works, and others in the 29-54, 136-174, and 406-512 MHz bands.
For starters, try the Chicago Area Monitoring Association's Web site at
http://www.theramp.net/shabec/carma.htm
I'll bet you'll find some worthwhile frequencies to enter there.

Pat

Lets also put this into perspective. Cell sites normally do not point
their antennas UP, but moreso they do downtilts to cut down on
co-channel and adjacent channel interference. So even if the FCC did
approve them, at 30,000 ft, you would be hard pressed to find a signal
up there and moving at 500 mph, just imagine the handover success rate
you would have from cell to cell or carrier to carrier...

What kind of coax are you using, and how far does it run? If there IS activity, and you have lossy coax, then you're losing signal to the radio. Sometimes the stock antenna is better!
I'll probably get flamed for this, but RG-6 works quite well for receiving, regardless of what people say about the 75-50 ohm "Mis-match". It's only an SWR of 1.5 to 1, so don't sweat it!
Regards, Jim

Better idea: put it on the roof where it belongs. If your local Homeowner Mommies whine about it, tell them that it's a TV antenna and thus protected by federal pre-emption.

You know what I love? Driving through these new developments with strict covenants against any type of outside antenna...and seeing shiny new wireless cable antennas jutting from the roofs! These are the "diamond" shaped antennas, requiring strict line-of-sight, and are mounted 20-40 feet above the roofline. Complete with multiple sets of guywires, large tripods, etc. Not a damn thing the Homeowner Mommies can do about it. Makes my day!

This is only from memory so take it for what it is worth. I believe
the Ohio Turnpike freqs are 155.790 or 155.970 can't remember .
Also try 155.625or something like that. The Ohio Highway Patrol Smokey
in the Air uses 45.02 (or was it 44.02?)

Could soemone explian me how I can programm an EDAC trunking bank.

I read the book that came with my new scanner a lot of time but still can't understand.

Example : EDAC system frequencies have to be programmed logically. Does this mean in sorted order or a frequency can be higher and enter a lower one after ?

A lot of commands described in the manual don't work.

Any help ?

best regards

2951. PRO2067 questions / comments

Newsgroup: rec.radio.scanner
Date: 2000-08-08 00:00:00 UTC
From: Don Pomplun <k2hug@home.com>
Message-ID: <398F8162.2C1CB72D@home.com>
Source record: 82888

1. I read that EDACS frequencies need to be entered "in order". Does this mean in "increasing frequency order", or some other. The system I listen to is the Bay Area Rapid Transit EDACS system. The web page that I found with the frequencies was in increasing order. Having entered them that way, how do I know if it is correct?

2. I saw some posts that the 92/2067 sometimes doesn't show the channel ID (in line 4). I see that on the Alameda County system (which I'm told is a Motorola I). On the BART EDACS system, an ID is always shown, though sometimes the conversation doesn't seem to match what I expect.

3. In an intro to the 92/2067, the author said:
a. "the radios don't use the data channel". Is this true? I thought that the actual voice channel didn't carry group info; that it was all in the data channel.
b. "when programming a Motorola system, you don't need the fleet map". I think I understand the concept involved, but the "easily understood" information in the manual makes no sense to me. Steer me towards something more logical, please.

Thanx

Source record: 82889

The 245 tracks EDACS flawlessly. That is all I use it for.
In Edacs, you must program the frequencies in 'logical order' this may or may not be in contiguous order.
You find out what the order is either by experimentation, or lists on the web or from Uniden.

When I first got mine last July, I hadn't a clue. but followed the trunk programming example in the book exactly and it came right up.
Later on , the system added frequencies and I noticed a gap in qsos now and then. I went in and reprogrammed the logical freqs in order and all is good.

All the commands in the book work. TO help yourself, believe that it will work fine and that you just need to understand how to use it. Then if you can't get it from the manual, ask a specific question designed to get a specific answer. "how do i get it to ..". etc.

Saying I tried it and it doesnt work does not lend itself to helpful hints.

Read the trunk programming chapter and do exactly as it says -- if you still have problems, say exactly what the problem is. Should be able to sort it out then.

I'd like to see a chapter and verse quote on that one. The FAQs around
the net and the companies selling SCA receivers and modifications don't
seem to agree with you. Radio Shack even used to sell one, maybe still
does (I haven't checked lately).

http://www.toltbbs.com/~bhammond/sca.htm (FAQ)
http://clients.dialnet.net/scsradio/ (kits and FAQ)
http://members.aol.com/fmatlas/ (radios, faq, stations w/subcarriers)
http://www.ldsradio.com/howtolisten/0,5499,4,FF.html#fm (mormon church)

The source of most of the "it is illegal" rumors are typically the
service or equipment providers who don't want consumers listening
for free. While it is illegal to play music or other copyrighted
works in public without paying royalties, such is not the case for
non-business, i.e. personal use.

Are you affiliated with said providers, or just repeating rumours?

Yes imagine my surprise. FAQ's on the 'net in conflict with law.
Radio Shack not only used to sell one, but they published schematics
for do it yourself receivers, and included legal advice on their
use. All of that was before the revision of the communications act.
Which specified that signals that were not for general reception by
the public, as SCA are not, are illegal to monitor without
permission. In the case of SCA specific language was applied.
Someone posted a paragraph earlier in this thread, maybe you can
find it.
I also own the ART/Sci series of technical manuals delineating,
among others, cell restoration mods for various receivers. Published
in 98, it's clearly in violation of ECPA, and yet, it shows up all
over the place.
Just because someone provides technical data, or hardware for a
purpose, doesn't mean it's use isn't illegal.

Of course there are those who will argue to the contrary. They
are entitled to be wrong.

For the most part unenforcable, but still illegal.

Yes, that's what Napster said, too.

SCA is not a matter of royalty, but in many cases, of
subscription. Of the stations that I have worked carrying SCA
transmissions, several carried telemetry between the transmitter and
the studio on their SCA subcarriers. Unauthorized monitoring of this
is illegal, as it is priveleged information. Usually digitally
encoded, which is clearly specified as protected from unauthorized
monitoring under the law.
Of the stations not carrying telemetry on their SCA, several
stations used their subcarriers to provide programming services.
Physicians Radio Network was one. Assorted music services,
datacasts, weather services were examples of others. These were by
subscription only. Unauthorized use of any kind, even person use, is
theft of service. Again rarely prosecuted. But specifically illegal.

One network I worked with, a state public radio network used the
SCA subcarriers to carry remote studio backhaul, and remote studio
communications, to the main studio at the flagship station. These
are specifically protected by the revised communications act, and it
is illegal for unauthorized monitoring under any circumstances.
>
> Are you affiliated with said providers, or just repeating rumours?

Nice shot...but neither. I work with the carriers who apply the
SCA to their signals, and specifically, monitor, and measure, SCA
transmissions on them.

> Sub-carrier... (technical background)

A frequency used to modulate a carrier wave that is itself
modulated.

99.5 MHz is modulated by 67khz. 67khz is modulated by a 8k audio
channel. 67khz is a subcarrier of 99.5.

FM Stereo uses a 38khz amplitude modulated subcarrier to carry the
difference audio for the stereo stage, L - R.
> Ku
> C Band
spectral allocations in this instance satellite spectra.

> PRN...

Physicians Radio Network, a subscription service carried by
SCA(Subsidiary Communication Authority...authorized programming or
communications service applied to a subcarrier on a broadcast FM
signal) in many markets, for doctors and medical practicioners.
Surgical developments, medical news.

> ...(all good stuff)

composite clipping: hard limiting of total modulation, (all audio,
subcarriers, stereo pilot) of a broadcast signal by clipping of the
total modulation, rather than gain reduction of the offending
component.

Baseband: the modulation component of an FM broadcast signal
below 15 khz carrying audio.

Does that help?

Another "God-complex" Extra. You sound like a guy I know who drinks 5-6 double scotchs at happy hour and drives home. Never had any problems, so it must be alright. Just because you haven't had any problems doesn't mean they can't happen.

Here is the report mentioned earlier from the NASA website.

A General Aviation pilot navigating by normally reliable VOR receivers wandered off-course, and discovered that an unexpected culprit was the cause of the navigation discrepancy.

After departing VFR, I picked up an IFR flight plan, and was given a clearance. Abeam one intersection, Approach advised that I was 7 miles south of course and provided a heading to reintercept. I began course correction and configured the Loran for course guidance. On further comparison, it was determined that both VOR receivers were suspect as they both indicated 8 degrees off. This prompted a query of the two passengers, children ages 7 and 12, after which it was found that both were using portable tape players. Both units were turned off, and the VOR receivers returned to normal operation.

Air carrier aircraft are not the only ones susceptible to the effects of portable electronic equipment. Small aircraft, too, can experience interference with potentially serious results, particularly in IMC conditions.

Since I don't expect an Extra to admit he might be wrong, even when given evidence to the contrary, I'll just put you on my block sender file.

Don't you just love these ham op's who are so full
of themselves, or somethin else, that the are compelled
to send 350Kb long postings to newsgroups of
stupid certificates, what don't mean *jack-shit*
to anyone outside of their own cloistered groupings of
technologically obsolete wierdoes..?

Went to Dayton the first time this year. Looking for test gear.
Thought I was at a cross between a gathering of "Revenge of The Nerds"
hollywood extras and a unification Church gathering. I was quite amused
by that overweight sea-hag what tried to convince me for 10 minutes
that ham radio was the greatest thing since sliced bread and peanut
butter. (she looked like she ate several helpings of each per hour...with
her 4 walkie-talkies snapped onto her fanny-pack-strap what was
easily a size 58 or better - sheesh! What an appropriate representative for
ham radio)

Gunman accidentally kills himself
IRVINE, August 9 • A man unwittingly took his own life today, when he fired a bullet into the cheek of a colleague while holding him in a headlock, shooting himself in the chest, police said.

The shooting at the premises occupied by Power Wave
Technologies, which manufactures wireless-communications
products, involved two employees of that business, said
Irvine police Sgt. Tim Smith.
"There was apparently some kind of argument at Power
Wave," at 2004 McGaw Street, Smith said, adding that
police were called about the incident at 12:40 a.m.
"Apparently they were working together. Both were
employees of the business."
One of the men apparently tried to kill the other, grabbing
him in a headlock and firing at point blank range in a bid to
shoot him in the head, Smith said. The bullet went through
the intended victim's cheek and into the shooter's chest,
killing him, Smith said.
The man who fired the gun was pronounced dead at
Irvine Medical Center, Smith said. The other man was
taken to Western Medical Center in Santa Ana, where his
condition is not known. Their names were not immediately
released.
Police were called to investigate the incident at about
12:40 this morning.

>I put two of Lenmar's batteries in the provided charger for the Icom
>R2 and they both blew up during the first charge cycle...

Not terribly surprising. NiCd and NiMH chargers supply an approximately constant current to the cells being charged. In the case of dumb trickly chargers like the Icom-supplied one, this current is supplied continuously regardless of the state of charge of the cells. This works find for NiCd and NiMH cells because they are designed to handle the overcharge current without harm (as long as the current and time are limited).

Rechargeable alkaline cells are an entirely different chemistry which CANNOT handle any overcharge. Chargers for these cells either supply a constant voltage, or they supply pulses of power to the cells and then monitor cell voltage between pulses.

So the two types of cells require quite different charger designs.

Dave

2970. Broken Microdec Morse Code display, help requested!

Newsgroup: rec.radio.scanner
Date: 2000-08-09 00:00:00 UTC
From: "Steven G. Bradley" <steven@magicnet.net>
Message-ID: <3991CBA9.A56E0568@magicnet.net>
Source record: 82657

While away at college for a few years, some of my equipment had not been used for a while. Now I am done and home I found my morse code display has quit working, competely, in the past four years. It is a Microdec MD-100, made by Somerset Electronics, Satellate Beach FL. It has a battery charge indicator, SSI indicator, and intensity/mode switches and volume control. It uses a 9V AC adapter to charge 6v worth of five nicads in series originally bought from Digikey based on the label. I used to use it for receiving the morse code ID periodically broadcast from VHF/UHF two way radio repeaters.

Here is what I have so far done - disconnected the batteries as they are old and may have died, I plan to check them later to see if there is any power in any of them as well as check the AC adapter for actual power output. I have also tried a different AC adapter with correct polarity, voltage, etc, that is known to work. So far, nothing works. I don't want to buy new batteries if the decoder is not going to work.

Please help if you have any suggestions. Not sure if it needs the batteries in it for it to work with the AC adapter, but it is possible. I plan to check it out with a meter later tonight to check batteries and power supply and see if I can figure what is going on, any help would be appreciate, e-mail preferred, posting here is ok too. Anyone else have this problem? I'd really like it to work again!

Steven

Not important, important is how much OUTPUT we are talking about here, and the fact that it would never show up on in the cockpit on a receiver MADE to receive this, let alone professional equipment used by planes that is really not going to be affected by something as trivial as this.

> Now, think about where the VOR antenna is. It's not just
> plausible, it's *likely* that these "tape players" were the cause.

No. Try taking a tape recorder and go into the next room with a receiver specifically TRYING to receive anything from the tape player. After you give up trying, then realize that the aircraft equipment isn't even LOOKING for this in the first place.

Its kind of hard to use. I think it was written to be an alternative to what Motorola sells to check your system. It provides a lot of the same data as Trunker but allows you to monitor speific things for diagnosis. I think there is an egroup list for it. I've used it a few times but find Trunker meets my needs better.

Tim,
Apparently they are doing things differently up in Michigan. Here in Oklahoma, which is the 8-lane super highway section of tornado alley, the on-duty forcasters/meteorologists take over the announcements when giving watch/warning information during periods of severe weather. Of course, I'm in the Oklahoma City/Norman broadcast area, and Norman is the home of both the Severe Storms Lab and the Storm Prediction Center, so crewing during severe weather is pretty good, allowing sufficent manpower to make the alert broadcasts.

Its time to buy a new scanner or have it calibrated. Its off frequency or
their phone is.

Your scanner is locking on 5 kHz away from the center frequency. The
actual freqs are 46.770 & 49.830, the most common of the old 10-channel set.

From the FAF - Frequently Asked Frequencies
on http://www.strongsignals.net/htm/oak_faf.htm

Cordless Telephone [15.233]

Chan Base Handset Chan Base Handset

1 43.72 48.76 16 46.61 49.67

>Can someone explain where the ANSI and FCC RF exposure standards came
>from?
>
>Peter S
>
Most health standards are derived from studies where they expose
animals/tissue to whatever is being rated, [gamma, beta, nutron, RF
chemicals, ligth [laser] etc]. They pick a level of that is much less then the
level or concentration where biological effects are noted.
Lasers are a good example. The typical "mammal" eye can withstand
X amount of laser light, so they define the "safe" level to 1/100 of that
amount of power. This is a gross oversimplification. Most
things are not linear in their effect. By reducing the levels to below
the maximum "safe" level to a safe legal level helps to insure
that there is no bad long term effect.
OF course we all "knw" that ionizing radiation
[Alpha/beta/gama/nutron] are bad. And we do not want to receive any that we
do not need. Except there are some studies showing that very minor levels
might be saver then "0" levels. Cancer vs Radon levels show a big dip at
very low levels, then the cancer rate climbs as the level decrease further.
The Dr Dean Adel show made reffernce to studies just completed in Japan, where
people who received more than "background" but still low levels
had viewer health effects than those who recieved no additional radiation.
They have had some major leaks so I guess they have enough zapped people to do
some usefull studies.

"Perfect Paul"? :-) As good a name as any. My mother-in-law thought he was Swedish. She once told me she thought his English was getting better. It took me a while to convince her he was a computer.

The transmitter here in Naples, FL, (WWG92) is run by the Miami office. When they use a voice recording, the person in the studio often has a heavy accent. I find Perfect Paul to be at least as intelligible as they are.

Interestingly, when there is a weather alert for this area, they interrupt Perfect Paul with a recorded tape loop announcing the alert.

It has got to be there phone then ! My Yaesu FT-920 picks up the handset frequency on same frequency that my Pro-64 does . I heard that there was some older type 40mhz cordless phone that operated on different 40mhz frequencies. Don't know . But I saw my neigbor on the front porch and the phone they used had one of those metal pull up antennas. It could be one of those older type I guess. I could be wrong about the whole thing though. Thanks for your time and help. Sam alphacentauri@i-plus.net

Pre-recorded
>movies on TAPE players

If either of those 'tape players' had an FM radio in them the local
oscillator could account for the VOR discrepancy described.

There was a terrible mid-air collision accident in NYC in the early sixties.
The cause was found to be an FM radio whose LO affected the VOR in one of
the planes.

>from?

They're derived from known thermal heating effects caused by RF.
There is a safety factor of roughly 10 applied to this standard. So
for example, although 10 milliwatts per centimeter squared is actually
the safe limit for an X band police radar, the standard today is 1
milliwatt per centimeter squared.

They call it "prudent avoidance." Frankly, I'm not impressed, but
I'll live with it.

Localized thermal heating is the only documented effect RF has on
human tissue. There are substantial efforts being made to model human
tissue heating at 900 MHz using salt water as an assumed model for the
human head. However, this is far from accurate. Nobody is quite sure
just how much energy your head absorbs from a cell phone, or whether
that energy can be properly dissipated.

Mr. Jacobs, have you considered that the "tape players" may also have
had an active FM receiver inside? Care to guess what frequency the LO
was on? Now, think about where the VOR antenna is. It's not just
plausible, it's *likely* that these "tape players" were the cause.

>> Air carrier aircraft are not the only ones susceptible to the effects of

>fairy tales like this, yet choose to believe that it is perfectly ok to put a
>microwave generating device like a cell phone next to one's head and that THAT
>does not cause any problems.

I am an extra class ham, an electrical engineer, and an instrument
rated pilot. I have used a handheld radio while flying my airplane.

YOUR SPECIFIC INSTALLATION may work just fine. Another one may not.
This is not a fairy tale. The reason for the regulations is not to
keep people from using their RF toys. The reason for this regulation
is to keep the aircraft on course so that they won't become a hazard
to everyone else nearby. The flight crew has no way of knowing for
certain that you won't interfere with their gear somehow. So by
default, it is prohibited.

>> Since I don't expect an Extra to admit he might be wrong, even when given
>> evidence to the contrary, I'll just put you on my block sender file.
>
>I have no problem admitting I am wrong, but that rarely happens. You know WHY?
>Because I don't make statements unless I know what I am talking about! If I am
>unsure of something, I don't make ANY statements on the matter. How are YOU on
>admitting you are wrong???

You are wrong. You don't know what you're talking about. We're
talking about ALL electronic devices and you're whining that "MY stuff
won't interfere." Why should a flight attendant believe YOU? How do
they know that YOU are blessed with this holy knowledge that your
equipment really does not interfere with the avionics?

The answer is that they don't know, they can't know, and they can't
take chances. So the common denominator applies to everyone, EVEN
YOU!

See 47CFR97.11 and 14CFR91.21 for details.

The bottom line: go buy your own airplane, get your own license, and
then you can use whatever toys you want while toodling around in the
sky. It will be your neck at risk (along with any passengers who have
the misfortune to fly with someone as arrogant as you). Until then,
get a clue.

There is also the matter of speed - I know of some private pilots who routinely use cell phones in the air (not much to go wrong in what is a basic manual aircraft) and they system doesn't seem to be much affected by speeds up to about 200mph or so. Over that you begin jumping between cells too fast for the computer to keep up and would enter the twilight zone of "untracked call". In reality, the ban on airline cell phone calls was instigated by the network operators to prevent "free" calls (cell links once open stay open until closed by the computer; however, the actual billing portion needs to have a smooth transition from cell to cell and not from cell to another cell 35 miles away. The transmission doesn't automatically activate all cells within transmission range, it just works with the cell it's hooked to and then the system determines what the next cell link should be based on transmission (reception to the cell tower) and connects them in a "hand off". If there is a number of cells activated at the same time, the system thinks that they are dealing with a cloned phone (which is why phase linear amplifiers would cause more problems for a user than they would solve) and either cut off the call or log the intrusion into a "look up later" file.

Ain't networks fun?

Who Did you Expect? (None@dontevntry.oro) on 9 Aug 2000 11:53:56 GMT wrote:
>It will take several days to get to the law library and might not happen until

That's why the web is so great. The entire US Code is online. If, however, you can find case precedent, that would be great! My lexis-nexis search was barren but very brief (what do you expect for nothing?).

Note, precedent for illegal business use of SCA signals is common. That is a big don't care! We only care about the actual reception, not reception and disclosure. A business use, or reception for financial gain is illegal!

I was sent some e-mail, but since the sender has chosen not to post publically, their identity shall remain unknown (it was NOT the Ralph mentioned on the page). It was claimed to have originally come from an attorney to them, thence to me:

It contains specific law under which SCA interceptions have been prosecuted. He has prosecuted them himself. And has assisted Federal and other authority in prosecutions under this law.

Enjoy.

http://floridalawfirm.com/privacy.html

Given no information to the contrary, I have to assume those prosecutions above were when someone used this reception in a business or for financial gain. The law above, in spite of the "florida" in the URL, is the U.S. Code. This is simply Title 18, which I posted myself a few mesages back. It appears to have been edited specificaly for satellite reception, so the cornell reference I posted earlier is much more complete (http://www.law.cornell.edu/). As I posted then, it does NOT rule out SCA reception but only disclosure or usage in business or for financial gain. It mentions "subcarrier" in only two places, once in a definition, (subcarriers are defined as not "readily available" and once in reference to satellite broadcasts:

(ii) as an audio subcarrier intended for
redistribution to facilities open to the public, but not
including data transmissions or telephone calls, is not an
offense under this subsection unless the conduct is for the
purposes of direct or indirect commercial advantage or private
financial gain.

Again, that is ONLY for satellite, but notice the last phrase, "IS NOT AN OFFENSE..." (emphasis mine).

The key to the whole SCA thing is contained in sec 2511 1, (a) thru (e). (a) thru (e) are AND clauses. This may not be clear unless you read a lot of law, whereupon you notice that OR clauses must specify "or" and these clauses do not.

Read 18USC119.2511.1 over and over again.
It does eventually make sense!

I've done that, many times.

> However...in matters of radio, especially where legal limits on
>reception are concerned, few enter into these discussions with an
>intent to understand the law, only to justify their intent to
>continue to break it, on the Grounds du Jour.

Gee, I thought the bigger problem with radio law was on transmission!

But in any case, I have never owned a receiver for FM SCA. I have
played with one a few years ago at Radio Shack.

> Your own posts have expressed a clear contempt for the law as
>typfied by the phrase, "even if it IS the law, it's still crap," of

I have a lot of contempt for stupid laws. Like the ones which sent
Japanese Americans to concentration camps. Like the ones which
condoned slavery and those which create a class of sub-humans. Bad
laws should be ignored.

>a couple of transactions ago, and your insistence that what is done
>that is 'not for business," is legal by default. Despite the fact

That's what title 18 says.

>that in cases where an SCA service is a subscription service, it is
>clearly intended to be paid for, even for use privately in the home.

So as long as I promise not to listen to subscription SCA I am legal?

Read those subscription agreements sometime as to exactly WHAT it is
you subscribe to. The two I have seen are for two things: equipment
lease, and public performance of the signal received.

>tacit testimony to the fact that you're not interested in the facts,
>only justification for your own behaviours.

Sorry, not my behavior, just my position in regards to
the law and (un)common sense.

> Fine. I've never had the patience to teach a pig to sing. But if
>you finally decide to find out the truth...look it up,-- you can use

You haven't been reading, Peter! If you had, you would know
I have ALREADY done the "look it up". I have done web, usenet
and (with a limited imposition on a law librarian and para-legal I
know) legal searches.

I have DONE my research, and have been posting the results -- NADA!

YOU, OTOH, simply keep repeating your position ad infinitum,
with no research or effort beyond repeating rumors.

> But something tells me you'll be just as quick to dismiss
>it...because you really don't want to be responsible for knowing the
>law.

I try to be very responsible for knowing the laws. Especially radio
and computer law since I'm amateur at one and professional at the
other. You guess which one.

>two choices of YOURs without option to acknowledge the truth.

When you finally decide to read the references I've posted, or come up
with your own, I'll be listening.

> Something I"ve also come to expect from Usenet.

Yawn.

Source record: 82736

You know, unfortunately most scanners are complete shit as far as picking up airline frequencies (poor sensitivity and rotten dynamic range). 118-137 MHz is all AM mode, and scanners do not do well at all in AM mode, since everything else is WFM. They are not really designed for AM reception.

I have a Drake SW-8 shortwave receiver ($800) and it kicks my BC235XLT up, down, left, sideways and frontways as far as how it does on the airline freqs. That's because a shortwave receiver is primarily AM mode and so it is designed for AM, and works best with AM.

Source record: 82737

Thanks for the advice on the 20-176 antenna; I put one in the attic and it works great for my needs. The NOAA station now comes in very clearly. Total project cost: about thirty dollars.

As for the wire, again, thanks for the input. I was going to use some Belden quad-shielded RG6 left over from wiring the house for cable; but the cost of connectors/adapters exceeded the cost of a prefab piece of RG-58 at Radio Shack, so I went the cheap, expedient route. Maybe it's a limiting factor, but the overall results meet my needs.

Best,
Carl Van Camp

I am after some of those in depth reviews of scanners/receivers, where they really put them through a thorough workout and give the results and specs...
Do they call these "White paper" reviews or similar..?
In the past I have seen one or two of these sites but like usual I didn't bookmark them... Of course, now that I want them, I can't remember where they are.... Typical isn't it!!!
Any info would be appreciated... Many thanks.

Hello all,
I just picked up an Icom IC-R1 and have no idea how to operate it!
It's not very intuitive. If anyone could give me a brief overview of
it's functions and operation it would be greatly appreciated. I really
don't want to order a manual if I can figure it out without it.

Thanks,
Jim

Thank goodness the R2 cannot charge internal batteries. I lost a 2 meter HT rig due to rechargeable
alkaline leakage. Since then, I gladly take out my R2's weak batteries, charge them outside, and replace
the unit with fresh (NiHydride) batteries. This also has the advantage of swipe cleaning the contacts.
Many people consider the R2's lack of ability to recharge internal batteries is a nuisance, but I obviously
have no problem with it based on past experience.

Perhaps I just don't choose to get into a debate about sources.
There's an old maxim..."how do you say Fuck you on Usenet?....Cite
your source."

It has been my experience that references posted by one party are
dismissed by the other especially in matters of law. But if the
dismissive party looks it up himself, they're more likely to believe
what they read.

However...in matters of radio, especially where legal limits on
reception are concerned, few enter into these discussions with an
intent to understand the law, only to justify their intent to
continue to break it, on the Grounds du Jour.
Your own posts have expressed a clear contempt for the law as
typfied by the phrase, "even if it IS the law, it's still crap," of
a couple of transactions ago, and your insistence that what is done
that is 'not for business," is legal by default. Despite the fact
that in cases where an SCA service is a subscription service, it is
clearly intended to be paid for, even for use privately in the home.

And that your insistence that my position is based in either
program supplier prejudices or rumor as the only two choices is
tacit testimony to the fact that you're not interested in the facts,
only justification for your own behaviours.

Fine. I've never had the patience to teach a pig to sing. But if
you finally decide to find out the truth...look it up,-- you can use
the same search engines as anyone else--and you can believe what is
there...because I didn't write it.

But something tells me you'll be just as quick to dismiss
it...because you really don't want to be responsible for knowing the
law.

> Tho' I'm glad that since you couldn't put up, that you have decided to
> shut up.
>

Spoken with civility I"ve come to expect from Usenet. And again
two choices of YOURs without option to acknowledge the truth.

Something I"ve also come to expect from Usenet.

Subject: Evidence John Mackey Lied About His "Articles"
Content-Type: text/plain; charset=us-ascii
Content-Transfer-Encoding: 7bit

OK Toilet Boy, you say you've written lots of articles for the
ARRL and other technical journals. The ARRL does not show you as
author for anything and no articles in ANY technical journals
have been found. Here is the proof that you lied about your
articles.

Several people have visited the ARRL Web Site (www.arrl.org), and
searched, finding nothing written by you. You claim they used
faulty search methods. Here are the results of my search of the
ARRL Web Site using "john mackey" and "ka0ssf" as search
parameters. Before you get all excited and claim my search method
was faulty because I did not use any capitalization, the search

engine is case INsensitive.

Regarding the search for "john mackey," the first, third, and fourth hits showed only because of "John" and "Mackey". The second hit refers to The ARRL Letter for July 5, 1996. That was the issue the contained the item about PARG catching a jammer.

Regarding the search for "ka0ssf," the only hit was a duplicate from above.

The original article appeared on the PARG web page (www.parg.org) does not credit you as the author. That article is reproduced below in its entirety. The next article is from the HamRadio Online website (www.hamradio-online.com), also reproduced below in its entirety, does show you as author. Finally, the item in The ARRL Letter is shown below as well. It does not credit you as author either.

It is interesting to note that the HamRadio Online piece appeared in the June 1996 issue and the PARG piece appeared in July 1996. Why would your own group not credit you with authorship? Why would you use the email address of someone else (mscott@teleport.com) instead of your own? Oh yes, I remember now. That was the time (March through August 1996) that you were using one of eight bogus addresses because you were stealing Internet access. Let's see, you were using the addresses:

John.Mackey_Jr@p234.f40.n105.z1.fidonet.org
John.mackey_jr@p234.n40.f105.z1.fidonet.org
Here.now@present.com
no.address@anywhere.com
no.address@anywhere.gov
No-place@anywhere.org
no--place@any-where.com
no__place@any__where.com

Comparing the three articles side by side, it is very clear that the first article, which appeard in HamRadio Online, was reworked for the PARG web page. Then the ARRL edited it for their use. No matter how you slice it, you have not written several articles, as you've claimed.

Again, Toilet Boy, you lied.

And now, the evidence:

Amateurs Locate Police Jammer in Oregon

by John Mackey, KA0SSF, mscott@teleport.com

During June 1st, 1996 in Seaside Oregon, where the SEA-PAC ham
convention was being held, a group of hams belonging to PARG
(Phantoms Amateur Radio Group) were down on the beach front
enjoying the annual PARG bonfire. One of the hams (KB7YZS) was
monitoring the local Seaside Police Dept. He heard someone
cursing and yelling at people. At first he thought it was
coming from the UHF side on his hand-held transceiver, but to
his surprise it was coming from the VHF side which was
monitoring the police.

He promptly notified everyone at the bonfire to listen. After a
few minutes of listening to the person, the members had figured
out that the person was up in a balcony, was with 3 or more
people and 2 of which were females. They realized this because
of key things he said and voices in the background.

The 4 PARG members in the group (KB7YZS, KB7YZR, N7XMD, and AA7UP)
just happen to be most of the PARG Interference Committee. They
immediately activated the PARG Interference Committee direction
finding operations. They promptly tracked down the interference
to a specific location of the Shilo Inn and searched for someone
matching the description. After only 5 minutes they saw a group of
people on the third floor of the Shilo who matched the description.
Then they saw him pick up his hand-held transceiver and speak into
it. At the very same moment the voice on the police frequency was
saying "Hey, fat ass, yea you in the black pants and the white

shirt". While he was saying this on the Seaside Police frequency the members noticed a man wearing those clothes, a little on the heavy side walking directly underneath them.

One of the PARG members saw a Seaside Police patrol car in the area. A PARG representative approached the officer and asked him if he was looking for a person causing interference to the Police Frequency. He seemed very upset and replied "YES"! The PARG representative then informed the Seaside Police Officer where the malicious interference was coming from. Three other PARG members were on their way to the third floor when they saw the people (from the room/balcony where the interference was) come running down the stairs and away from the Shilo.

The officer took a report from the PARG representative, including an exact location of the motel room and spoke to the hotel manager. After 2 hours the interference started up again. The Seaside Police Officer went directly to the room the PARG Interference team pointed out and caught the person in the act of doing the deeds.

The above is known to be facts. The above mentioned is knowledge from speaking the PARG Interference Committee members and to a friend of the suspect.

The man who in is question has a call sign of KE6VNU and is from Central California. He apparently was in Oregon for the ham convention. Information indicates he was released from jail only a short time before this incident, the charge he was in jail for was malicious interference to the local police in his area. This obviously did not teach him his lesson. We understand that he caused a great amount of interference to the Sacramento County and Roseville emergency/public services communications and often identified himself on those malicious transmissions as "The Phantom Jammer". We were told the charge Seaside Police brought against him was "Interference of a police officer in line of duties".

Note: It is an unfortunate coincidence that the malicious interferer used the name "Phantom Jammer". He has absolutely NO association with or relation to PARG (Phantom's Amateur Radio Group), the group which located him & turned the necessary information into the Seaside Police which led to his arrest for the interference. We did not release this information until now at the request of the local law enforcement officials to prevent tainting their investigation.

This was PARG's second year in a row of providing public services during the Seaside Ham Convention. Last year several PARG members apprehended a purse thief (after a brief foot pursuit), returned the purse to the rightful owner, and detained the suspect until police could arrive. PARG also performed crowd control activities at this time due to the large number of people who stopped to

watch the purse thief incident.

PARG is the Phantom's Amateur Radio Group in Portland, OR and is Portland's most active VE testing, repeater club, emergency communications, and ham radio group. Please visit our web page at http://www.teleport.com/~mscott/dumb.shtml.
You can contact PARG at

PARG, PO Box 1586, Beaverton, Oregon 97075-1586

The PARG Crack
The Official Newsletter of the Phantoms Amateur Radio Group
"We are anything but complacent"

July 1996 - Portland, Oregon - ONLINE EDITION

Interference Committee Stops Californian Jammer

The SeaPac ham convention was saved once again by PARG representatives. In a valiant effort to restore peace and safety to the coastal community, members of the PARG Interference Committee assisted Seaside Police officers in the apprehension of an individual jamming their dispatch frequency.

During the annual PARG bon fire, several members of the Interference Committee were monitoring the local police dispatch frequency. As they were completing a safety check of the area before returning to their accommodations for the evening, the Committee members heard someone sending malicious transmissions on the VHF dispatch frequency. Immediately, the field operations of the Interference Tracking Unit (ITU) were activated and the search began for the jammer.

After a relatively short and efficient investigation, the ITU determined that the illegal signal was originating from a shore front hotel. This information was derived from both direction finding techniques and verbal clues left by the jammer.

The group immediately broke into two teams and sent a representative to contact a police officer who was patrolling in the area. The other team went to the hotel from which the suspected jammer was transmitting and watched his room for a possible escape attempt.

Soon after contact was made with the police department, the suspects were seen going down the hotel stairs and away from the building.

During the time that the suspects were out, the jamming ceased. About two hours later, the jamming started up again. When this happened, the officer the PARG representative had contacted returned to the room and apprehended the suspect.

According to reliable sources, the suspect, KE6VNU was arrested by the Seaside Police Department for the charge of Interfering with a police officer in the line of duties. In addition to being involved in this situation, the jammer was allegedly involved in similar activities in Sacramento County, California.

The outcome of any prosecution will be covered in a later edition of the PARG Crack.

========= July 5, 1996, reproduced without permission ========

PHANTOMS HELP NAB "THE PHANTOM JAMMER"

The Phantoms Amateur Radio Group (PARG) of Portland, Oregon, is claiming credit for helping police to nab "The Phantom Jammer," who was interfering with police calls in Seaside, Oregon, during the Northwest Division Convention in early June. John Mackey, KA0SSF, of PARG reports members were on the beach enjoying the annual PARG bonfire when KB7YZS heard someone "cursing and yelling at people" on the VHF police frequency, which he was monitoring at the time. After a few minutes of listening, members figured out that the person was up in a balcony and was with a mixed group. KB7YZS, KB7YZR, N7XMD, and AA7UP (who just happen to be most of the PARG Interference Committee) immediately activated direction finding operations and tracked down the interference to a local motel. It only took them a few minutes to spot a group on a balcony, one of whom was using an H-T. After noting that the transmissions coincided with what they heard on the police frequency, PARG informed Seaside Police. A short time later, Mackey reports, Seaside Police "caught the person in the act."

Seaside Police subsequently charged Bobby Lee Aguero, KE6VNU, of Rocklin, California, with interfering with a police officer. As we've already reported in The ARRL Letter and in QST, Aguero, 19, already faces similar charges in California.

Mackey said this was the second consecutive year PARG got to provide a public service during the Seaside convention. Last year several PARG members apprehended a purse thief--after a brief foot pursuit--returned the purse to its rightful owner, and detained the suspect until police could arrive. PARG has a Web page at http://www.teleport.com/~mscott/dumb.shtml. The group's current president is Justin Bousquet, AB7NG.

This data has been gathered by Joe Greco and sol.net Network Services
as part of an ongoing project to monitor Usenet trends and abuse.

There are currently two items scanned:

1) "From:" header
2) "NNTP-Posting-Host:" header, if present

All articles sharing the same header (i.e. all articles with a
"From:" header of "jgreco@ns.sol.net") are counted together, with
a summary of the number of posts, bytes posted, and BI. Only
articles that have a BI of 20 or greater are summarized.

Please remember that BI is a general formula to measure the
number of groups posted to in a manner which favors crossposting.
The fact that the posts of a single poster may have a BI of 20
does not imply that the articles are spam, as each article may
have been completely different and unrelated.

Let's see, according to WhoWhere? <http://www.whowhere.com>, you've used
no less than sixteen obviously fictitious Internet addresses. These are
just the ones where you were stupid enough to use your callsign. You
might plausibly claim one or two were used by someone impersonating you,
but you can't claim all of them Toilet Boy.

In light of the abuse you've managed with fraudulent address, your
ragging on Bill Cheek about the WinRadio issue in the manner you
have been, makes YOU the hypocrite here, as usual.

That's an apples and oranges comparison. The time periods are not equal.
But, you're too stupid to understand such simple concepts, Toilet Boy.

==========
You claimed you were not the most proflic poster of off topic messages.
You lied.

With the aid of DejaNews, I have analyzed the quantity of postings by several regular posters in the alt.radio.scanner and rec.radio.scanner news groups for a one year period and compiled the statistics. The full one-year period between August 1, 1997 and July 31, 1998 was examined on a month by month basis. All the the people were subject to the same search and level of scrutiny.

Seven people who are, or who have been accused, of being high frequency posters were selected. Those people are John Mackey, Bill Cheek, Richard Kendrick, Blake Bowers, George Vetterle, allsafe, and K4CC. The addresses
used by these individuals were the seed for the search.

In the case of Mackey he has used ten different addresses during the selected time period and all ten were used. Those address are: jmackey@usa.net, jmackey@parg.org, kaossf@parg.org, jmackey@parxg.org, jxxxmackey@uxxxsa.net, ka0ssf@premovearg.org, jmackeyremove@usa.net, ka0ssf@paremoverg.org, and jmackey@pio.net.

Bill Cheek changed from cts.com to san.rr.com before the examined time period and his posts from that domain are not included in this survey. The address used was Bill Cheek <bcheek@san.rr.com>.

George Vetterle changed providers, but this only added five to his total count of messages posted. The two addresses surveyed are: geovet@ix.netcom.com and geovet@thevision.net.

The other address used were Richard Kendrick <wa7twi@primenet.com>, Blake Bowers <bbowers@townsqr.com>, <allsafe@netwit.com>, and <k4cc@aol.com>.

This is the quantity of postings broke down on a month by month basis for each of the people named above. If a message was cross-posted to both qroups, it was only counted once.

Date	Mackey	Cheek	Kendrick	Bowers	Vetterle	allsafe	K4CC
JUL 98	413	386*	6	32	28	75	234
JUN 98	413	502*	0	64	45	97	95
MAY 98	22	208	0	11	8	12	12
APR 98	194	128	27	41	25	12	0
MAR 98	254	240	49	24	50	18	0
FEB 98	200	274	51	27	46	18	0
JAN 98	173	178	35	1	33	33	0
DEC 97	149	227	32	0	16	1	0
NOV 97	63	65	1	0	10	0	0
OCT 97	48	60	0	0	8	0	0

SEP 97 | 181 | 78 | 0 | 2 | 4 | 0 | 0
AUG 97 | 29 | 2 | 0 | 1 | 2 | 0 | 0

TOTALS | 2139 | 2348 | 201 | 203 | 275 | 266 | 341

AVG/DAY| 5.86 | 6.43 | 0.55 | 0.56 | 0.75 | 0.73 | 0.93

AVG/ADJ| 5.86 | 6.43 | 0.95 | 0.74 | 0.75 | 1.09 | 3.72

The TOTALS are the sum of twelve months of posts for that individual.

The AVG/DAY is the average number of posts per day based on the formula TOTALS / 365.

The AVG/ADJ is TOTALS / SUM OF DAYS IN TOTAL MONTHS OF POSTINGS is the average number of posts for the actual days in the news group. The adjusted value is because some of the posters had a 0 for any given month(s).

The two months marked with an asterisk (*) for Bill Cheek are inflated values. The actual values are probably much lower because these values included the reposts of the messages canceled by John Mackey.

Consider this point. Less than two dozen of the total posts by Mackey pertained to scanners or scanning. Approximately half of the posts made by Bill Cheek were devoted to scanners and scanning. Now go back and look at the numbers again. You do the math.

For the others, between one-eighth and one-half of the posts made by them were pertaining to scanners and scanning.

I use WD-40 all the time on swiches (rotary, AC power, relays, you name it), noisy potentiometers, sticky slugs in old UHF rig inductors, locks, and anything else that slides or turns. Doesn't hurt any of 'em. It's one of the Great Inventions of the 20th Century (along with latex paint and plastic drinking straws. .)

Subject: Proof of Bill Cheeks Mensa Membership
Content-Type: text/plain; charset=us-ascii
Content-Transfer-Encoding: 7bit

I have been able to verify that Bill Cheek did indeed once belong to American Mensa, as he claimed. In the 1983/1984 Directory of American Mensa Membership, there is a listing for William David Cheek, 235 Pike Street, Golden, CO 80401, (303) 279-1447. Bill Cheek was not listed in the 1985, or subsequent editions of the directory.

A check with the National Mensa office in Fort Worth, TX revealed the following facts about a persons membership. Once a person has qualified for membership, he is qualified for life. He may let his membership lapse at any time for any reason. He may then rejoin at any later time by simply paying the current dues. A members IQ does not drop as soon as his membership expires, as John Mackey would have us believe.

Gee, it looks like Bill Cheek DID tell the truth, unlike John Mackey.

So that's how you're trying to describe suppressing the truth about you,
Toilet Boy? You can keep trying to emulate your Nazi propaganda heroes,
but you're out of your league there. You lack the intellect to
understand
their methods.

Here are a few pieces of evidence for you chew on, Toilet Boy.
This should keep you frothing for a while. You know the rest of
the evidence exists; this is enough to prove my point. You are
a liar and a fraud, Toilet Boy.

To your dimwitted friend Larry Johnson, two things:

First: Not only is the emperor wearing no clothes, but he's
wearing last year's fashion.

Second: Go commit intrapersonal intercourse.

Newsgroups: rec.radio.scanner,alt.radio.scanner
Subject: Evidence John Mackey Lied About His "Articles"
Content-Type: text/plain; charset=us-ascii
Content-Transfer-Encoding: 7bit

OK Toilet Boy, you say you've written lots of articles for the
ARRL and other technical journals. The ARRL does not show you as
author for anything and no articles in ANY technical journals
have been found. Here is the proof that you lied about your
articles.

Several people have visited the ARRL Web Site (www.arrl.org), and
searched, finding nothing written by you. You claim they used
faulty search methods. Here are the results of my search of the
ARRL Web Site using "john mackey" and "ka0ssf" as search
parameters. Before you get all excited and claim my search method
was faulty because I did not use any capitalization, the search

engine is case INsensitive.

Regarding the search for "john mackey," the first, third, and fourth hits showed only because of "John" and "Mackey". The second hit refers to The ARRL Letter for July 5, 1996. That was the issue the contained the item about PARG catching a jammer.

Regarding the search for "ka0ssf," the only hit was a duplicate from above.

The original article appeared on the PARG web page (www.parg.org) does not credit you as the author. That article is reproduced below in its entirety. The next article is from the HamRadio Online website (www.hamradio-online.com), also reproduced below in its entirety, does show you as author. Finally, the item in The ARRL Letter is shown below as well. It does not credit you as author either.

It is interesting to note that the HamRadio Online piece appeared in the June 1996 issue and the PARG piece appeared in July 1996. Why would your own group not credit you with authorship? Why would you use the email address of someone else (mscott@teleport.com) instead of your own? Oh yes, I remember now. That was the time (March through August 1996) that you were using one of eight bogus addresses because you were stealing Internet access. Let's see, you were using the addresses:

John.Mackey_Jr@p234.f40.n105.z1.fidonet.org
John.mackey_jr@p234.n40.f105.z1.fidonet.org
Here.now@present.com
no.address@anywhere.com
no.address@anywhere.gov
No-place@anywhere.org
no--place@any-where.com
no__place@any__where.com

Comparing the three articles side by side, it is very clear that the first article, which appeard in HamRadio Online, was reworked for the PARG web page. Then the ARRL edited it for their use. No matter how you slice it, you have not written several articles, as you've claimed.

Again, Toilet Boy, you lied.

And now, the evidence:

==== June 1996, reproduced without permission ===

Amateurs Locate Police Jammer in Oregon

by John Mackey, KA0SSF, mscott@teleport.com

During June 1st, 1996 in Seaside Oregon, where the SEA-PAC ham
convention was being held, a group of hams belonging to PARG
(Phantoms Amateur Radio Group) were down on the beach front
enjoying the annual PARG bonfire. One of the hams (KB7YZS) was
monitoring the local Seaside Police Dept. He heard someone
cursing and yelling at people. At first he thought it was
coming from the UHF side on his hand-held transceiver, but to
his surprise it was coming from the VHF side which was
monitoring the police.

He promptly notified everyone at the bonfire to listen. After a
few minutes of listening to the person, the members had figured
out that the person was up in a balcony, was with 3 or more
people and 2 of which were females. They realized this because
of key things he said and voices in the background.

The 4 PARG members in the group (KB7YZS, KB7YZR, N7XMD, and AA7UP)
just happen to be most of the PARG Interference Committee. They
immediately activated the PARG Interference Committee direction
finding operations. They promptly tracked down the interference
to a specific location of the Shilo Inn and searched for someone
matching the description. After only 5 minutes they saw a group of
people on the third floor of the Shilo who matched the description.
Then they saw him pick up his hand-held transceiver and speak into
it. At the very same moment the voice on the police frequency was
saying "Hey, fat ass, yea you in the black pants and the white

shirt". While he was saying this on the Seaside Police frequency the members noticed a man wearing those clothes, a little on the heavy side walking directly underneath them.

One of the PARG members saw a Seaside Police patrol car in the area. A PARG representative approached the officer and asked him if he was looking for a person causing interference to the Police Frequency. He seemed very upset and replied "YES"! The PARG representative then informed the Seaside Police Officer where the malicious interference was coming from. Three other PARG members were on their way to the third floor when they saw the people (from the room/balcony where the interference was) come running down the stairs and away from the Shilo.

The officer took a report from the PARG representative, including an exact location of the motel room and spoke to the hotel manager. After 2 hours the interference started up again. The Seaside Police Officer went directly to the room the PARG Interference team pointed out and caught the person in the act of doing the deeds.

The above is known to be facts. The above mentioned is knowledge from speaking the PARG Interference Committee members and to a friend of the suspect.

The man who in is question has a call sign of KE6VNU and is from Central California. He apparently was in Oregon for the ham convention. Information indicates he was released from jail only a short time before this incident, the charge he was in jail for was malicious interference to the local police in his area. This obviously did not teach him his lesson. We understand that he caused a great amount of interference to the Sacramento County and Roseville emergency/public services communications and often identified himself on those malicious transmissions as "The Phantom Jammer". We were told the charge Seaside Police brought against him was "Interference of a police officer in line of duties".

Note: It is an unfortunate coincidence that the malicious interferer used the name "Phantom Jammer". He has absolutely NO association with or relation to PARG (Phantom's Amateur Radio Group), the group which located him & turned the necessary information into the Seaside Police which led to his arrest for the interference. We did not release this information until now at the request of the local law enforcement officials to prevent tainting their investigation.

This was PARG's second year in a row of providing public services during the Seaside Ham Convention. Last year several PARG members apprehended a purse thief (after a brief foot pursuit), returned the purse to the rightful owner, and detained the suspect until police could arrive. PARG also performed crowd control activities at this time due to the large number of people who stopped to

watch the purse thief incident.

PARG is the Phantom's Amateur Radio Group in Portland, OR and is Portland's most active VE testing, repeater club, emergency communications, and ham radio group. Please visit our web page at http://www.teleport.com/~mscott/dumb.shtml.
You can contact PARG at

PARG, PO Box 1586, Beaverton, Oregon 97075-1586

The PARG Crack
The Official Newsletter of the Phantoms Amateur Radio Group
"We are anything but complacent"

July 1996 - Portland, Oregon - ONLINE EDITION

Interference Committee Stops Californian Jammer

The SeaPac ham convention was saved once again by PARG representatives. In a valiant effort to restore peace and safety to the coastal community, members of the PARG Interference Committee assisted Seaside Police officers in the apprehension of an individual jamming their dispatch frequency.

During the annual PARG bon fire, several members of the Interference Committee were monitoring the local police dispatch frequency. As they were completing a safety check of the area before returning to their accommodations for the evening, the Committee members heard someone sending malicious transmissions on the VHF dispatch frequency. Immediately, the field operations of the Interference Tracking Unit (ITU) were activated and the search began for the jammer.

After a relatively short and efficient investigation, the ITU determined that the illegal signal was originating from a shore front hotel. This information was derived from both direction finding techniques and verbal clues left by the jammer.

The group immediately broke into two teams and sent a representative to contact a police officer who was patrolling in the area. The other team went to the hotel from which the suspected jammer was transmitting and watched his room for a possible escape attempt.

Soon after contact was made with the police department, the suspects were seen going down the hotel stairs and away from the building.

During the time that the suspects were out, the jamming ceased. About two hours later, the jamming started up again. When this happened, the officer the PARG representative had contacted returned to the room and apprehended the suspect.

According to reliable sources, the suspect, KE6VNU was arrested by the Seaside Police Department for the charge of Interfering with a police officer in the line of duties. In addition to being involved in this situation, the jammer was allegedly involved in similar activities in Sacramento County, California.

The outcome of any prosecution will be covered in a later edition of the PARG Crack.

========= July 5, 1996, reproduced without permission ========

PHANTOMS HELP NAB "THE PHANTOM JAMMER"

The Phantoms Amateur Radio Group (PARG) of Portland, Oregon, is claiming credit for helping police to nab "The Phantom Jammer," who was interfering with police calls in Seaside, Oregon, during the Northwest Division Convention in early June. John Mackey, KA0SSF, of PARG reports members were on the beach enjoying the annual PARG bonfire when KB7YZS heard someone "cursing and yelling at people" on the VHF police frequency, which he was monitoring at the time. After a few minutes of listening, members figured out that the person was up in a balcony and was with a mixed group. KB7YZS, KB7YZR, N7XMD, and AA7UP (who just happen to be most of the PARG Interference Committee) immediately activated direction finding operations and tracked down the interference to a local motel. It only took them a few minutes to spot a group on a balcony, one of whom was using an H-T. After noting that the transmissions coincided with what they heard on the police frequency, PARG informed Seaside Police. A short time later, Mackey reports, Seaside Police "caught the person in the act."

Seaside Police subsequently charged Bobby Lee Aguero, KE6VNU, of Rocklin, California, with interfering with a police officer. As we've already reported in The ARRL Letter and in QST, Aguero, 19, already faces similar charges in California.

Mackey said this was the second consecutive year PARG got to provide a public service during the Seaside convention. Last year several PARG members apprehended a purse thief--after a brief foot pursuit--returned the purse to its rightful owner, and detained the suspect until police could arrive. PARG has a Web page at http://www.teleport.com/~mscott/dumb.shtml. The group's current president is Justin Bousquet, AB7NG.

This data has been gathered by Joe Greco and sol.net Network Services
as part of an ongoing project to monitor Usenet trends and abuse.

There are currently two items scanned:

1) "From:" header
2) "NNTP-Posting-Host:" header, if present

All articles sharing the same header (i.e. all articles with a
"From:" header of "jgreco@ns.sol.net") are counted together, with
a summary of the number of posts, bytes posted, and BI. Only
articles that have a BI of 20 or greater are summarized.

Please remember that BI is a general formula to measure the
number of groups posted to in a manner which favors crossposting.
The fact that the posts of a single poster may have a BI of 20
does not imply that the articles are spam, as each article may
have been completely different and unrelated.

Let's see, according to WhoWhere? <http://www.whowhere.com>, you've used
no less than sixteen obviously fictitious Internet addresses. These are
just the ones where you were stupid enough to use your callsign. You
might plausibly claim one or two were used by someone impersonating you,
but you can't claim all of them Toilet Boy.

In light of the abuse you've managed with fraudulent address, your
ragging on Bill Cheek about the WinRadio issue in the manner you
have been, makes YOU the hypocrite here, as usual.

That's an apples and oranges comparison. The time periods are not equal.
But, you're too stupid to understand such simple concepts, Toilet Boy.

==========
You claimed you were not the most proflic poster of off topic messages.
You lied.

With the aid of DejaNews, I have analyzed the quantity of postings by several regular posters in the alt.radio.scanner and rec.radio.scanner news groups for a one year period and compiled the statistics. The full one-year period between August 1, 1997 and July 31, 1998 was examined on a month by month basis. All the the people were subject to the same search and level of scrutiny.

Seven people who are, or who have been accused, of being high frequency posters were selected. Those people are John Mackey, Bill Cheek, Richard Kendrick, Blake Bowers, George Vetterle, allsafe, and K4CC. The addresses
used by these individuals were the seed for the search.

In the case of Mackey he has used ten different addresses during the selected time period and all ten were used. Those address are: jmackey@usa.net, jmackey@parg.org, kaossf@parg.org, jmackey@parxg.org, jxxxmackey@uxxxsa.net, ka0ssf@premovearg.org, jmackeyremove@usa.net, ka0ssf@paremoverg.org, and jmackey@pio.net.

Bill Cheek changed from cts.com to san.rr.com before the examined time period and his posts from that domain are not included in this survey. The address used was Bill Cheek <bcheek@san.rr.com>.

George Vetterle changed providers, but this only added five to his total count of messages posted. The two addresses surveyed are: geovet@ix.netcom.com and geovet@thevision.net.

The other address used were Richard Kendrick <wa7twi@primenet.com>, Blake Bowers <bbowers@townsqr.com>, <allsafe@netwit.com>, and <k4cc@aol.com>.

This is the quantity of postings broke down on a month by month basis for each of the people named above. If a message was cross-posted to both qroups, it was only counted once.

Date	Mackey	Cheek	Kendrick	Bowers	Vetterle	allsafe	K4CC
JUL 98	413	386*	6	32	28	75	234
JUN 98	413	502*	0	64	45	97	95
MAY 98	22	208	0	11	8	12	12
APR 98	194	128	27	41	25	12	0
MAR 98	254	240	49	24	50	18	0
FEB 98	200	274	51	27	46	18	0
JAN 98	173	178	35	1	33	33	0
DEC 97	149	227	32	0	16	1	0
NOV 97	63	65	1	0	10	0	0
OCT 97	48	60	0	0	8	0	0

SEP 97 | 181 | 78 | 0 | 2 | 4 | 0 | 0
AUG 97 | 29 | 2 | 0 | 1 | 2 | 0 | 0

TOTALS | 2139 | 2348 | 201 | 203 | 275 | 266 | 341

AVG/DAY| 5.86 | 6.43 | 0.55 | 0.56 | 0.75 | 0.73 | 0.93

AVG/ADJ| 5.86 | 6.43 | 0.95 | 0.74 | 0.75 | 1.09 | 3.72

The TOTALS are the sum of twelve months of posts for that individual.

The AVG/DAY is the average number of posts per day based on the formula TOTALS / 365.

The AVG/ADJ is TOTALS / SUM OF DAYS IN TOTAL MONTHS OF POSTINGS is the average number of posts for the actual days in the news group. The adjusted value is because some of the posters had a 0 for any given month(s).

The two months marked with an asterisk (*) for Bill Cheek are inflated values. The actual values are probably much lower because these values included the reposts of the messages canceled by John Mackey.

Consider this point. Less than two dozen of the total posts by Mackey pertained to scanners or scanning. Approximately half of the posts made by Bill Cheek were devoted to scanners and scanning. Now go back and look at the numbers again. You do the math.

For the others, between one-eighth and one-half of the posts made by them were pertaining to scanners and scanning.

I use WD-40 all the time on swiches (rotary, AC power, relays, you name it), noisy potentiometers, sticky slugs in old UHF rig inductors, locks, and anything else that slides or turns. Doesn't hurt any of 'em. It's one of the Great Inventions of the 20th Century (along with latex paint and plastic drinking straws. .)

Newsgroups: rec.radio.scanner,alt.radio.scanner
Subject: Proof of Bill Cheeks Mensa Membership
Content-Type: text/plain; charset=us-ascii
Content-Transfer-Encoding: 7bit

I have been able to verify that Bill Cheek did indeed once belong to American Mensa, as he claimed. In the 1983/1984 Directory of American Mensa Membership, there is a listing for William David Cheek, 235 Pike Street, Golden, CO 80401, (303) 279-1447. Bill Cheek was not listed in the 1985, or subsequent editions of the directory.

A check with the National Mensa office in Fort Worth, TX revealed the following facts about a persons membership. Once a person has qualified for membership, he is qualified for life. He may let his membership lapse at any time for any reason. He may then rejoin at any later time by simply paying the current dues. A members IQ does not drop as soon as his membership expires, as John Mackey would have us believe.

Gee, it looks like Bill Cheek DID tell the truth, unlike John Mackey.

3055. Re: Bearcat 760 XLT, 2 types ?HELP**

Newsgroup: rec.radio.scanner
Date: 2000-08-10 00:00:00 UTC
From: klarrg@aol.com
Message-ID: <20000810093511.14305.00000128@ng-cd1.aol.com>
Source record: 82601

Hi,

Maybe you can put light in the darkness !

Some people say the Bearcat 760XLT covers the 30Mhz band, but others swear
to tell it starts only at 66 !!
Are there 2 different types of the Bearcat 760XLT or is there a difference
in USA and Europe ?

Hope you got the right answer !

Thanx for reading,

Greetings,

EagleForce
Renï¿½.

There is a USA version AND a European version. The USA one STARTS @ 30 Mhz: the
Euro one @ 66 mhz. Our USA "low band" is from 30-50 Mhz: THEIRS is from 66-88
Mhz.

3056. RS "pro" series chronology?

Newsgroup: rec.radio.scanner
Date: 2000-08-10 00:00:00 UTC
From: Scanner Geek <cordey@my-deja.com>
Message-ID: <8muchv$jn4$1@nnrp1.deja.com>
Source record: 82602

So does anyone know of a canonical list of the different RS scanners over the years? I have three of varying generations, but when I see others posted for sale (like one recent post of one that noted to have been purchased before the FCC restricted some frequencies) I have no idea of the features of the various models.

I'm note real interested in the cellular stuff, I'm more interested in design "cookies" or those things that the creators put in to be fun or useful, but are not advertised or documented in the manual: For example:

... I'm curious to know if anyone had ever discovered that PRO-29 has a "hidden" weather alert mode? I was running one on two (yup just two) UHF (ham) frequencies during a recent public service event during approaching severe weather. I also had a weather alert radio too, and when I heard "it" scream - I discovered that the PRO-29 (propped on a box, not being handled) had switched to the local NOAA station, and was screaming an alert tone.

It's never done this before or after - but it's things like this that I'm interested in.

Additionally - I saw the recent postings about the issues with lack of IDs on the PRO-92A. I bought a PRO-91 on closeout (glad I didn't pay a lot, the local trunking system is only used for garbage collection at this time!) and have been stymied by results I'm getting when trying to get another set of trunked freqs to work.

So pointers to RS info is solicited. Personal anecdotes about random goofy design cookies especially appreciated.

-R

Gerry Wheeler <gwheeler@vmguys.com> wrote:

> "Perfect Paul"? :-) As good a name as any.

The boxes that do the voice synthesis are DECtalk boxes,
which have been obsolete since the mid 80s. Each of the
voices that the box can produce has a nickname; that's
just one of them.

Our DEC field service engineer had to use an automated
phone menu system to keep the office aware of what was
going on. He called DECtalk "Ol' Marblemouth."

As for the Germanic accent -- I believe you could switch
accents in DECtalk. Thankfully, I never had to use one,
but our local WX radio produced some... interesting...
sounds when DECtalk tried to pronounce the ICAO ids. :-)

I read that cellphones contain circuitry to prevent them from accessing more than one cell site at a time. Even if that isn't accurate, a cell phone being used on the ground is likely to access more than one cell site at a time. But ultimately, the site with the best signal is chosen to complete the call, so the number of sites it accesses initially should not matter.

yes, but - the fact is - it (phone) transmits and the cell tower receives (the tower IS the "cell") The phone arbitrates to receive from a maximum of 1 cell at a time with some swapping during the hand-off itself. (figures out which signal is increasing and which is decreasing and shifts back and forth until the signal is established on the higher signal site) When some people transmit from mountains, they undoubtedly light up several cells at once (not a problem in Kansas or Oklahoma, though). Cell phones assume ground level operation, for some reason ;-)

According to the proof above provided by Deja.com John (call me toilet-boy or Corky) Mackey is more than a liar. He strikes me as very very sick. These are just 15 of the different names he has used in the past few months. Thousands of messages but all are calling people liars or trying to convince us John (call me toilet-boy or Corky) Mackey is better than a dead man.

I am going to forward this to abuse@home.net his ISP. Maybe they can help stop the one called John (call me toilet-boy or Corky) Mackey from further destroying this and the Ham Radio hobby.

Try www.winradio.com with trunk tracking software. Similar radio to the PCR1000.

Yes, tell me, how much OUTPUT are we talking about here. That's
governed by 47CFR15. And by the way, 47CFR15 only sets design limits.
It doesn't guarantee that any given FM receiver will not interfere.

>> Now, think about where the VOR antenna is. It's not just
>> plausible, it's *likely* that these "tape players" were the cause.

>first place.

You'd better seek further education before you discuss this any
further. Avionics radios aren't really that sophisticated and they
don't know to how to "LOOK" for a signal.

The LO frequencies of most FM broadcast radios are right in the middle
of the band used by the VOR navigation beacons. You can't filter a
leaky LO from the pass-band of a VOR receiver because it is a real
on-frequency signal --not some IMD product.

Did you know that VORs transmit a 30 Hz rotating cardioid antenna
pattern with a reference subcarrier on 9960 Hz +/- 480 Hz FM ? Now,
take a carrier, even a weak carrier from an LO, and mix it together
with a distant VOR signal and what happens?

VOR technology is not as robust as you might first think. It dates to
the early 1950's when "portable" radios were heavy tube powered
affairs. The notion of accidental interference from on-board
entertainment devices probably wasn't on the minds of the engineers.
The standard became quite a success in its day. Since then it has
been deployed all over the world. Now it's really too late to change.

Yes, as a matter of fact, a VOR is highly susceptible to interference. Did you know the FAA has a small fleet of aircraft which periodically recertifies each and every instrument approach in the US? That's one reason why.

Mr. Jacobs, I'm going to reiterate this fact to you one last time before this thread goes to the kill file:

The decision to use any portable electronic device on board an aircraft of any type is not yours to make. That use is prohibited by default and permitted only at the discretion of the pilot in command. Regardless of what you may know or believe of your own radio gear, and of the capabilities of the avionics on board, the word of the pilot in command is final.

I agree with you that it is unlikely your cell-phone would interfere with the avionics on board. But even having said that, I'll be damned if I would let you use it while descending on an ILS in low IFR conditions. And if you poll a reasonable sample of instrument rated pilots, I think you'll discover widespread agreement with this position. The additional risk just isn't worth it.

73,

Jake Brodsky, AB3A mailto:frussle@erols.com

Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.shortwave

For years before they started using the 500 MHZ trunk system Sayreville has used what they refer to as the "Off Duty Channel" and I believe they also called it "Channel 8". They have been on the 500 Mhz trunking system and I still hear conversations where they refer to switching to the "Off Duty Channel or Channel 8" Their old dispatch frequency used to be 460.250 and I assume it is somewhere between this and the 503 MHZ. The frequency is not listed in Scanner master or Per conn database unless it's listed in a newer version. Does anyone out there know this frequency ? your help is appreciated.

I have 2 brand new OptoElectronics OptoTrakkers that I would trade for 2
Connect Systems CD-2's (with LTR) or 3 CD-1's (with no LTR).

I need the larger display of the Connect Systems units, and do not need
the Trunk Tracking capabilities of the OptoTrakkers.

If interested please email me at rich@n9jig.com

According to press release, the new system is digital.
They went digital specifically so criminals couldn't listen
into their traffic. It did create one problem. Mutual
aid is no longer available via radio.

Almost everything around St. Louis has gone to trunk systems, and I've got a few really nice scanners that I no longer use. I'll sell them outright or possibly trade for any kind of trunk tracking scanner (hand held, base, whatever)... Everything is in excellent condition and works without any known problems.

2 each RS Pro 2039 - An excellent, sensitive, 200 channel, 800mhz, ten scan banks, priority, search, etc....includes 30-54,108-174, 380-512, 806-823.93, 851-868.93, 896-999 among others - and many additional features. I liked this one so much I bought two of 'em... $75 each obo.

Bearcat BC80XLT - 800Mhz - My favorite handheld - 50 Channel scanner, Auto band search (11 bands), 72 hour Memory Backup, AC/DC Operation, Built-in Scan Delay, Channel Lockout, Full-Frequency LCD Display, Keypad Lock, Low Battery Indicator, Manual Channel Access, one touch weather and more... $75.00 obo

Will trade one, two or all three for a trunk tracking scanner of equal value or sell outright.

Thanks,

John

You didn't mention what your anticipated price range is. But you should know that portable scanners that cover "ALL" ranges are not cheap. Secondly, you should know that none of them cover "ALL" ranges. -- they all are blocked in the cellular bands.

The Uniden BC 2500xlt and BC 3000xlt are discontinued now.
The Radio Pro-26 is discontinued now. I think the AOR 8000--- series are discontinued now too

Some models to consider are: Alinco DJ-X10T
Icom R-2, Icom R-3, AOR 8200--- series

NONE of these are cheap radios.

Yes, I am. Thanks for asking.

Doing PSK31 Alot, one of the most amazing and easy modes of Operating ever.

go to http://www.qsl.net/k8cpa and check out the link to psk31 info page, to find out about it.

I'm also getting on 75 meters, not very often, as I'm working alot of hours, and just don't have alot of time on my hands. and for the record, CD, It's Chuck, Not chuckie... I'll tell you what, you call me chuck and not chuckie and I'll call you CD and not Nigger boy. Deal?

Tape recorders have a high frequency (supersonic, anyhow) bias oscillator to erase and to bias the heads so they don't record in the tape's non-linear region. A harmonic of this oscillator COULD interfere with reception of a non-directional beacon.

Can pick up a new Sony IFC-SC1 (recently discontinued) for around $130.00 - $150.00, or the same radio with PC control for around the $200.00 range. Maybe you can find even better prices on these, but these are from sources that I know have some stock now.

That's true; I do my own maintenance on my equipment and I've looked at
and adjusted these signals with scopes many times.

> A harmonic of
>this oscillator COULD interfere with reception of a non-directional beacon.

IMO this is much more unlikely than the FM LO theory. The LO fundamental
could be *on* the VOR carrier freq. You're talking about an oscillator
that's normally around 200 kHz and which is applied to the head in amounts
measured in tens of millivolts; furthermore, it's generated as a fairly
pure sine wave! The output at the 540th harmonic and beyond just isn't
going to be detectable.

Also, if we're talking about Walkman-style units, "tape players" with FM
radios are fairly common, but "tape players" with a record function are
like hen's teeth.

Now if it's a "boombox" style, *most* of those *do* include a record
function, but I still don't believe the output at 108 MHz and up would be
measurable above the background noise.

3094. Speech Inversion Descrambling/Scrambling

Newsgroup: rec.radio.scanner
Date: 2000-08-10 00:00:00 UTC
From: ctpds49@aol.com
Message-ID: <20000810194132.10123.00000297@ng-cd1.aol.com>
Source record: 82640

Speech Inversion is accomplished by mixing the speech spectrum
(typically 300-3000 Hz) with a tone (commonly 3500 Hz) to produce some
audio frequencies (3800-6500 Hz) then filtering to 3200-500 Hz
constituting the speech inversion.

Is it a FACT that you are a human being? Show the newsgroup where THAT fact is! Try to PROVE that! Not such an easy or light task, is it? I do not need to waste hours of time finding the research and retyping it here just to satisfy you in order for the fact to remain true.

If you choose not to believe this, although I can't understand why, since if you knew anything about radio and rf you could not possibly take the defense you are, that will not affect me in the least. I am not going to waste an hour finding the material for you. Why don't YOU do some research yourself on this subject and see what you find? Could prove interesting!

Try "looking" at those signals on a radio receiver 10 feet away. (with another desired signal on that same frequency) You won't be able to SEE it at all.

> > A harmonic of
> >this oscillator COULD interfere with reception of a non-directional beacon.

ABSOLUTELY NOT.

Another important thing to note. even if you brought a high powered transmitter aboard a plane that you built to specifically transmit on the frequencies in question and to cause massive interference.... guess what... the plane would STILL NOT CRASH!!! A pilot surely knows how to fly and land a plane with interference to these receivers! They could get interference from lighting or could go out at any time.

So... there is no way any consumer device (other than perhaps an electric razor) will cause any interference to the aircraft receivers, AND if there was, it would still not matter.

If you have a GPS receiver in your car, and you have a rule that no passengers can bring any
plastic cups in your car. Even if the plastic cup caused interference to your GPS receiver, you would not crash your car.

CASE CLOSED.

Chargers for NiCd and NiMH sense a characteristic voltage 'hump' so they know when to shut off. Using one to charge any other chemistry will result in overcharge which generates heat and gas. Over charge enough and BOOM (as someone else in this thread found out). You might try one of the other commercial chargers for rechargeable alkalines. You should be able to get one a Wal-Mart, KMart, Target, Radio Shack, etc.

First Aeroband receiver I ever had was made from an old TV tuner with
cobbled Ch. 7 coils. The output tank after the converter was padded down to
16.5 MHz or so and the signal connected to my BC-348. Not really stable,
but it worked.

Stridsberg makes a preamp specifically for 800 Mhz. I have not
personally tried it (signals strong enough in the area) but I do use
the MCA204 which allows connecting up to 4 four scanners and
the FM broadcast notch filter (strong FM stations in the area).

Anyone got any leads on whether you can get Trunk Tracking capability when you use a PCR 1000, or other similar laptop-driven type device? I'm going to be doing some heavy traveling with my laptop over the next year, and love radio scanning in the evening. But with more and more police/fire moving to trunked systems, it would be great to have that capability also.

Thanks!

Chris

Hmmm. I think you're mistaken in a few ways:

One, you keep saying "tape player". Granted that's what the NASA report said, but most portable "tape players" have FM radios too. I agree with you that a "tape player" by itself has no reason to contain any RF-generating components, but assume for a moment that these had an "FM radio" function and were being used as such.

Now realize that the IF frequency of FM radios is 10.7 MHz, and they use high-side injection. The VOR band is, it says here, 108 to 117.95 MHz. So if the FM radio is tuned between about 97 and 107 MHz, its LO frequency *is* in the VOR band, and the aircraft equipment IS looking for that frequency...

Next, distance: The receiving antenna is on the outside of the hull. Not near the cockpit (those are just readouts) but near the receivers, which are in the belly of the aircraft. We're on the inside... maybe fairly close to the antenna. The distance might be far less than "the next room". It just has to go out the window.

That incident is from quite some time ago; you'll find that older equipment consumes quite a bit more power and so generates more stray RF than current digital-FM-receiver-on-a-chip designs. Running the test you describe with modern FM radios isn't meaningful.

Sure, it's still just stray RF and weak. Then again, the VOR transmitter is many miles farther away. Maybe up to 100 miles away.

As a ham, you are concerned with not interfering with neighbors' radio and tv reception, so you know perfectly well that a wire (such as a headphone lead) that runs out from a gadget like an FM radio can act as a transmitting antenna for any stray RF generated inside the case. These wires are of course supposed to be bypassed to shunt any such RF to ground. What if the bypass caps were open? You seem to be generally assuming that all consumer equipment behaves correctly at all times.

Finally -- VOR isn't a simple radio receiving system. If we were talking about voice comms, I'd agree with you, there's no way that the weak LO signal from an FM radio could blot out an AM voice channel.

But VOR is much more subtle than that; it does it rely on conventional RDF (signal strength) techniques. You can read for yourself a capsule description of how it works at http://www.spiceisle.com/homepages/george-er/VOR.html . Briefly the receiver is measuring the phase difference between two signals transmitted on the same frequency; this phase difference varies according to the bearing from the VOR to the aircraft. It does not seem to me to be at all farfetched to believe that a weak signal near the receiving antenna, on or even NEAR the VOR carrier frequency, could cause false readings.

It would be really interesting to find out where that a/c was, the freq of the VOR transmitter in question, and the freqs of any nearby FM stations those radios might have been tuned to.

Negative, that's not what I said. I said, "once you take somebody's money..." If you are sharing flight expenses, you are not taking somebody's money, and you [the pilot] are also paying for a portion of the flight's cost. That is not the same as a flight operated for hire. Now, of course there are ops where a pilot takes money for hire under 14 CFR 91, and excercises privileges granted by a commercial pilot certificate (or better) and a second class medical certificate (or better). But I submit to you that these ops do not take place under conditions where take off minimums (originally a subject earlier in this thread) would apply.

> later" file.

Locally, cell phones were used in the early 90's aboard our private planes, before the FCC implemented the ban. This was never done under IFR. It caused havoc on the network, and this got worse as more cells were being added per sq mile. It wasn't a matter of handoffs too quickly, it was more that the cells were getting lit up all over the place. The AMPS standard allows for a channel to be repeated on non adjacent cells, so airborne use was clogging a large amount of cells, and preventing the provider from providing service. Today, it would be much worse as cells are much smaller, less powerful, and much more numerous.

Does anyone know the new freq. for Maricopa County Police. They just recently changed and I think it is a new trunking system or it might be like the military system via a secure system using the current freq. which if it is then forget trying to listen to them. Thanks

Proof or not, Mackey, it is clear to anyone with a mental age over 12
(i.e., everyone here but you) that you are a hateful, half-witted
psychotic with far too much time on your hands. "Verifiable" would
imply that someone other than yourself would give a damn about you long
enough to check the facts presented, and I doubt such a person exists.

And, here, I'll save you the trouble:

It also comes down to agency preference. I'm a firefighter for a mid-size fire department (17 engines/4 trucks) that just put a new 800 MHz digital trunking system in service about 6 months ago. The entire system was set up like you suggested, but the police department (500 officers) complained, and said that they needed to be able to talk over one another. Go figure...

I don't seem to hear much of that problem here. What I see as the problem is a geographical spacing problem. Why not space repeaters far enough from each other so that it is not a problem to begin with. Here in Northern New Jersey, there are frequencies occupied by different users who are much too close together; that's why you have to have a scanner with PL.

> I have also heard the Pro92A also has problems. How does it compare with
> the 92? Would the 92 with firmware upgrade be better then the 92A??

You will most likely not get a firmware upgrade for the 92. The 92A is supposedly some better but until they use control channel following they may never get the reputation for a great trunking radio.

> Would you recomend another brand or model HH scanner instead of the 92/92a??

BC245 does not have the problems associated with the 92/92A.

However, the 92/92A does conventional scanning very well and with alpha tags. However, both are severely overpriced, especially if you add the $60 software package. Depending on where you live and the usage of local trunking systems you may never experience problems with either of the 92 radios. I never had any problems with mine on 2 local systems.

3149. r7000 dispay goes away

Newsgroup: rec.radio.scanner
Date: 2000-08-11 00:00:00 UTC
From: wb6shi@arrl.net
Message-ID: <39934c10.46168594@news.directcon.net>
Source record: 82554

I have an old r7000 and even after the memory battery was changed the freq and channel number goes away if it has been off for a while. The radio seems to function ok otherwise. Reloaded the memory via cat and that also worked fine. I suspect a cap somewhere in the dispay section. Has anyone else fixed this problem, and how did you do it?

Norm WB6SHI

3152. Re: BC200XLT not receiving 150 MHz Band

Newsgroup: rec.radio.scanner
Date: 2000-08-11 00:00:00 UTC
From: Mike Gormley <WA8VEC@ARRL.net>
Message-ID: <3993525C.AC4FA28E@ARRL.net>
Source record: 82557

Ok, I did the reset function and sure enough all freq's are set to zero. But it did not solve my problem after reprogramming the 150 Mhz band. It does receive 118 to 130 Mhz, 400 mhz, 800Mhz ranges though.

Search function for 150 Mhz also does not work, but will on other bands. WX will not pick up weather either.

Called Uniden customer service, they weren't much help, beyond suggesting to send it in for repairs.

Anybody got any other ideas?

Mike Gormley

>>
>>Try taking a FM RADIO RECEIVER and go into the next room with a receiver
>>specifically TRYING to receive anything from the FM RADIO RECEIVER. After you give up

>>trying,

This isn't at all the same thing.

The LO output from an FM radio is a dead carrier and it is damned difficult to detect a weak dead carrier with another FM radio. It has to do with the minimum signal level needed for quieting.

The VOR receiver, on the other hand, is looking for phase differences between two signals using the same center frequency. One of them using amplitude modulation. This is MUCH more sensitive to interference from weak local signals your FM receiver will be.

>> then realize that the aircraft equipment isn't even LOOKING for this in the
>>first place.

I'll repeat THIS, so you can read THIS again: On the contrary -- the VOR receiver IS tuned to a frequency which is right in the middle of the range commonly emitted by your FM receiver.

I notice you also didn't bother quoting the rest of my post, regarding older FM portables having more leakage; the possibility of defective bypass capacitors or shields; etc., etc... couldn't rebut that part, eh?

Go read the article at http://amulation.com/md-l-archive/199708/msg00020.html . You'll find quotes from a number of folks (with considerably more credentials in this field than your Amateur Extra Class certificate) who believe you're wrong. It also cites an incident in which the correlation between FM radio use in the passenger cabin and VOR errors seemed very, very high.

> the call, so the number of sites it accesses initially should not matter.

That's all well and good, but the problem is that an airborne transmitter has a huge line of sight compared to a transmitter on the ground. This great line of sight translates into greater radiated power at higher distances. So the airborne cell phone might be automatically _assigned_ a close cell, but other cells farther away will receive the airborne cell's signal. So now, the remote cells with similar frequencies are effectively jammed by the superior signal of the airborne transmitter. The cell tower would command the airborne transmitter to reduce power, but the radiated power would still be enough to create a mess all over the cells within the great range of the airborne transmitter that operate on the same frequency as the cell that the airborne transmitter is legitimately talking to. .

I agree with everything you are saying except for that last statement. At least in the U.S. it is likely that VOR's will be phased out. Perhaps not in the 10-20 years that the FAA was originally calling for, but someday. It's a shame, and GPS is more susceptible to jamming b/c of the lower power progatated to your receiver from a satellite that has limited operating power and is several hundred miles away.

As an aside, it wouldn't take very much interference at all to cause a plane to be say 500 ft off course of the glide slope. Which sucks if there is a hill at 300 ft.

For Sale! $150
Radio Shack DX-394 AM-USB-LSB-CW SHORTWAVE RECEIVER.
It covers the 150 - 30000 Khz range, and thus will receive LF for beacons, the AM broadcast band, all shortwave and all amateur radio bands in that range. AM/CW/SSB capable, it has an LCD frequency readout and LCD signal strength meter. The DX-394 is an excellent choice for your general coverage receiver. Covers the entire HF spectrum! Operates on either 120VAC or 13.8VDC with optional power cord. This DX-394 is in very good condition. Telescoping antenna. Operational condition is excellent.

Click this link to see the radio!
http://www.geocities.com/dbnawell/dx394.htm

I can accept payment via PayPal if you prefer and that will get the radio shipped FAST!

Jamie,
A very impressive article, thanks for posting the link. It answers every one of SJ's statements with the facts. Of course, since it is based in part on government reports, he'll undoubtedly assert his superior knowledge, including his recent multiple-choice upgrade from advanced to extra (or was it a rubber stamp upgrade?). You know, if I didn't have a print-out from the FCC with his name and callsign, I'd swear it was mackey posting. He's even using mackey's trick of changing his posted email address to get past those of us who've used block sender on him. Anyway, the information listed in your link is really fabulous. I used to be a print photo-journalist, and this tempts me to try and develop a story for Mon. Times or Pop. Com. Have you got anymore great links like this? Please post them or email them to me. Even if I don't do a story (work is pretty hectic right now, spare time is limited), I'd sure like to read them.

Thanks a lot,
Mark K5MAR

3169. Trade Icom PCR1000 for R-10 or...

Newsgroup: rec.radio.scanner
Date: 2000-08-11 00:00:00 UTC
From: Yizeguy@webtv.net
Message-ID: <20134-3993B7E1-146@storefull-104.iap.bryant.webtv.net>
Source record: 82574

I have a PCR 1000 computer controlled scanner with all original
accessories, bought it new and just dont use it. I'd like to trade it
for an icom R-10 or an AOR 8000.
Not interested in any other models.
Thanks,
TC

Hi All!

The Giant Page O'Shortwave Links is going "DC to Daylight!" Now
covering all facets of the radio listening hobby, from longwave to UHF
and beyond! And not only links, but the page now includes original
features! There are only a couple non-link features now, but plans
are to have a 50/50 split eventually!

http://swlinks.webalias.com

AOL Users: <A HREF="http://swlinks.webalias.com">Click Here!</A>

Over 200 links to radio-related sites all over the Web -- please
enjoy! Radio is a fun and exciting hobby, and my sincere wish is for
the Giant Page O'Radio Links to reflect that sense of excitement, the
ability to both eavesdrop on and talk to the world! Any suggestions
for links or features are most welcome, and you can mail these to
fewtch@yahoo.com.

If you were listening to the ham bands when you heard the weather tones it was more than likely coming from there repeater. a lot of repeaters have weather alerts in them, that would explain why you heard them one time and not since.

Take care & God Bless ! Ken

3173. Discone Antenna

Newsgroup: rec.radio.scanner
Date: 2000-08-11 00:00:00 UTC
From: CDG <cox@iafrica.com>
Message-ID: <39940189.0@news1.mweb.co.za>
Source record: 82578

Hello

I am unable to put my discone antenna up outside of the building where I live, if I put it in the roof (between the ceiling and the roof tiles) will I be loosing allot of the signal strength?

Brendan

For a list of the frequencies used by the various railroads, try Jon Roma's list at:

http://www.uiuc.edu/ph/www/roma/rr-freqs

The list is sorted by railroad and by frequency.

Enjoy,

Steve Studley
Bloomington, IN

3177. Going to the Chicago Lakefront Air & Water Show?

Newsgroup: rec.radio.scanner
Date: 2000-08-11 00:00:00 UTC
From: Kim and Ted Moran <tandkmoran@nospamhome.com>
Message-ID: <7sUk5.149627$dF.4549717@news1.rdc1.il.home.com>
Source record: 82582

Drop me an e-mail if you'd like to hook up out there, we are going on Friday morning to try to bag some freqs and info, also plan on attending Saturday and perhaps Sunday too.

We'll be posting any early freq finds on our e-mail list:

go to www.qth.net to sign up for the carma list or send an e-mail msg to:

majordomo@qth.net

in the body of the message type:

subscribe carma

or

subscribe carma-digest

then follow the directions which will arrive shortly

If I have time I'll post confirmed freqs to the newsgroup, too.

Happy scanning, Ted

But once the call is established, it is going out from only one cell site, where ever that site might be located. True, cell sites might be affected at greater distances than from a ground level phone, but in the end only one cell site at a time will be handling the call.

gee, now all we have to do is get the signal out thru the fuselage and to
the antennas. Ever look at the antenna capability of those little heads?
We're not talking quality equipment here, but receivers pretty well
attenuate a constant frequency (unmodulated) signal.

Mackey, your "rubber-glue" mentality is really tiring, and has by now raised the noise floor of these NGs to an unprecedented level. Do you actually have anything useful to offer us, or are you just so mentally ill that this kind of stuff defines your only purpose for living?

If Internet bandwidth were as precious as the amateur radio spectrum bandwidth, you would have been shut down long ago. This behavior is simply not becoming of your (alleged) recognized status in the amateur radio community, and you should be damned well ashamed of your moronic behavior. Do us and yourself a favor by trying to apply yourself in a more constructive way.

I have my discone in my attic and I have not noticed any appreciable amount of loss. Your location will have some factor. If you are located in a metro area having it inside may have very little effect. Whereas in a rural area there may be some loss to those signals that are marginal. Of course this would also be true if the antenna were located outdoors but may be more of a factor when set up in an attic environment. However, for just general scanning it works great.

My ham and SWL antennas are also in my attic. I have no complaints. While any antenna will perform better outdoors, the attic or crawl space is a good alternative because at least it is up in the air. Just try to keep it as far away as you can from electrical wiring or anything that could cause noise or interference.

The nice thing about having an antenna indoors is that it will not deteriorate and requires little if any maintenance. You also do not have to contend with potential ice and wind dammage, if those are concerns where you live. I have had my antennas in the attic for five years and have not touched them since I first installed them.

My apologies. I wasn't very clear in my posting what system was vulnerable to interference. I'll be more specific. An NDB is a non-directional low frequency beacon in the range 190-400
KHz -- on the ground. What the AIRCRAFT carries is a receiver tuning to its frequency. By use of a loop antenna and a sense antenna, the receiver will drive an instrument to point towards the ground transmitter. This system is an Automatic Direction Finder, or ADF. A nearby generator such as a bias oscillator can overwhelm the signal picked up by the airborne
system; the antennas carried on the aircraft intercept very little signal. How little? Vacuum
tube ADF receivers (I've worked on 'em) used to even have trouble with noise generated inside
the tubes - and this, at frequencies AM broadcast and below. That's how weak an NDB signal is
by the time it reaches the aircraft.

The bias oscillator operates in the same band as the ADF receiver, and so is a direct threat
to it.

Not to be alarmist, and I understand ADF approaches are the exception these days. But that's
a plausible way for a tape recorder to interfere with one aircraft navigation system.

Cheers,

Cortland
(ka5s@saber.net)

IIRC, the original rulemaking prohibiting untested electronics operation was based on the presence in passenger's seat area of a portable FM radio during an approach that did crash. The
supposition was that the local oscillator of the FM radio had interfered with the ILS signal,
causing the aircraft to be in the wrong piece of sky during its descent to the runway. This is
not improbable, and even more so with a vacuum tube portable whose oscillator is more powerful
than those in modern FM portable receivers.

There are unanswered questions. The ILS flag should come up if the ILS signal was interfered
with. Did it? Who knows? It IS possible for the flag circuit to malfunction; I've seen it happen. The pilot SHOULD take over visually. Did he? Apparently not.

In any case, I wasn't talking about harmonics of the recorder's bias oscillator, but its fundamental frequency, to which ADF receivers are sensitive. And it's not difficult to interfere with a radio signal with a receiver LO. I've seen it done to great effect on a barracks-mate with an bad sense of timing. (12 PM on a week night). As to the operation of a
transmitter, I can tell you of the effect rectified nearby VHF signals have on logic boards. No
flag on those, either. Just "oops."

Regards,

Cortland
(ka5s@saber.net)

3185. Public Safety Doubling

Newsgroup: rec.radio.scanner
Date: 2000-08-11 00:00:00 UTC
From: zerg90@webtv.net
Message-ID: <25799-39943227-39@storefull-117.iap.bryant.webtv.net>
Source record: 82590

It seems to me that the biggest problem faced by most public radio systems is doubling (when 2 people talk at once). Isn't this a easily solved problem? Isn't it possible to put a small chip in every radio that will prevent a radio from transmitting if the channel is busy?

The only problem arises when there is a stuck mike - then no one can transmit. But the obvious solution is to have a override feature for this anti-doubling device.

I picture it working this way. If someone tries to transmit when a channel is busy, they get one or two beeps (essentially telling them to shut up). Then, if they need immediate access to the channel, they can just keep their PTT depressed and this would activate the emergency override feature (EOF). When the EOF activates, the radio begins to transmit on a special input frequency so that they can access the repeater along with the other transmitting units.

So you would have 2 voice messages coming over the repeater at the same time - but it would be better than a double where no intelligible messages are received. (Or if a simplex system - the EOF could pop the radio over to a clear freq for reaching the dispatcher which would also be the priority receive channel in the field units).

What do you think? Peter S

PS - I tried to bring this up on the Project 25 @ egroups.com list a couple of months ago but all I heard was "its a user problem" - "train the users better".

Your idea is not unreasonable, but my view is that greater system-level
sophistication (trunking as an example) is a more expandable and fault
tolerant approach, whereas your approach would be more of an
incremental improvement likely to introduce additional complications
(specifically, the requirement for an additional input frequency--think
how this could inefficiently chew up bandwidth). The most likely
implementation of this sophistication is to use digital transmissions
and protocols to manage message flow and multiplexing more
intelligently, such as we see now with packet radio, digital cell

phones and Internet TCP/IP.

Digital radio is already in widespread use (digital cell phones being the most obvious example), and many believe it is likely that use of analog radio will eventually be limited to hobbyists. This is, of course, very bad news for scannists! The scanning hobby will evolve as well, and has been, thanks to guys like Bill Cheek, et al.

That's EXACTLY what I thought.

As a rule, a childish, strawman response like that occurs when someone
has no basis for their position.

If what you claim was such common knowledge, and evident to anyone who
does ANY research, you could have included at least ONE URL to anything
of substance much more easily than posting yet another tantrum (or your
opinion stated more loudly, which I explicitly asked to avoid).

And, yes, I have researched this, and find nothing to support your
claim.

Neither can the FCC.
Neither can the FAA.
Neither can any pilot who isn't tripping on LSD.

God help anyone affected by your thinking.

Source record: 82449

I am currently researching what type of antenna I should use for a base scanner project for home. I scan mainly the aero bands (both civil and military). My goal is to achieve as much range (distance) as I can so that I can hopefully receive a couple of local airports (DFW and NAS Ft. Worth).

While reviewing the Diamond website, I noticed their D130J Discone antenna as well as their D707E Active antenna. Does anyone have any experience with either of these antennas?

Any feedback would be appreciated.

sward

Sward:

I've owned, and used both. The D130J discone it made very well, and for a wide-band, no gain, antenna, it works very well!

The D707E active antenna was a disaster! Both with, and without, using the amplifier, it's performance was not good. To be fair, I live in a densely populated RF environment, where it's not recommended to use a preamp of any kind. However, I gave it to a friend for his cottage which is in a more remote area, and he was very disappointed with the performance as well.

The cell transmitters use antennae systems with low radiation angles.
It provides some gain essentially for free. This tend to keep high
fields away from the area around the antenna, so they can safely be
sited in public areas, and also means little if any energy is directed
more than 10-20 degrees above the horizon. It is useless.
The result is the if you are 5 miles directly over a BTS, it is not
likely the cell would notice you. The BTS is essentially deaf looking
more than 70 degrees above the horizontal.

Delta used to allow them, they even used to specifically list them as OK in the in-flight magazine. As I remember it, they changed their policy about 1 1/2 to 2 years ago. I flew Delta round trip NY to Zurich two weeks ago and they were still forbidden.

If you can choose your airline, most United flights offer cockpit audio via the in-flight entertainment system. They occasionally don't turn it on though, so ask if it dosen't work. On two occasions, I asked and the pilot was happy to turn it on. Most of the time they even have it working as the plane is boarded, so you can listen to the ground control action while you're waiting to depart.

Have fun,
Barry

As I recall, these were dual conversion beasts which could pick up cellular even without trying and without modification, in the 400 mhz range. I know as I own one too, with the same mods, oh and I think mine may have the frequency range mod to up some extra frequency ranges between 66 and 88 mhz as I recall, the section they enable in the european versions. I did them all, a long time ago!

Yes, $50 is reasonable because in places where things are trunked, they are next to useless, and in the non-trunked areas, 43s or 51s are better. One tip, do not mention cellular mod in your advertising on e-bay or they will cancel your item. Instead leave your e-mail address for further questions and answer that one privately when asked, and yes, you will be asked unless it is a real newbie who does not know the difference between VHF and UHF!

Good luck,
Steven

The firmware version on the PRO-2067, and the PRO-92A is the same. However, some comments from users seem to indicate that both of these are less than perfect, and may even have problems the PRO-92 did not have. Or it could be a matter of learning how to use it properly. Time will tell.

Is it a good radio? Is it better as a shortwave receiver or as a scanner? Is it easy to operate, or does it have the usual dreadful AOR ergonomics? What about the spectrum display and the display in general? All comments welcome, thanks.

<<<<On 8/11/00 Daniel M. Conti responds to a request for anyone with information on a request for a Police Frequency>>>>

[[[[[[[[Unless the Sayerville NJ Police have begun broadcasting via Shortwave, this post is WAY off topic here.]]]]]]]]]]

I am sorry if my posting to both scanner and a short-wave group offends. After being a Ham operator for 22 years, a scanner and short-wave enthusiast for 25 years I didn't think it would be impossible that someone in the Short-wave group might also enjoy and have frequency information on scanners such as myself since I subscribe to both plus ham related groups. I assumed these newsgroups were here to help people enjoy their hobby and exchange information, not grounds to be flamed. If I am in the wrong group, just ignore the post. I would like to thank the numerous people from ALL 3 groups who responded with possible leads. As for Mr. Conti's comment I can only conclude that he is either a "NEWBIE" with absolutely no insight of helping someone if they have possible information of worth. Or is a MENTAL MIDGET who would rather make a moronic comment as he did rather than ignore the post if he could be of no help.

It is odd that I have had fair success with similar requests to closely related newsgroups in the past without idiotic reply's. Mr. Conti, I am NO NEWBIE to the internet or ham/scanner/short-wave radio I suggest that if you cannot help someone go to your local computer store and buy a "Newsgroups For Dummies" book, move along to the next post and keep your negative comments to yourself.

I have a Radio Shack Pro 2006 that I bought new in 1995 it has a date code of 1A4 and is in perfect cond. The reason that i am selling is I just don't use it enough, any way here is what is in the package:
The Radio has the following modifications.
Digital S-Meter / with front panel LED's
Analog S-Meter with jack
Data Tone Squelch mod. { switchable }
Extended delay, Adjustable 0-12 sec with front panel Led On Indicator
Carrier Status "Led" front panel mount
Center tune indicator "Led front panel mount"
Cell Mod
Diode speed up mod
10 Mhz Reference Mod with Bnc jack
4 Unused front panel mounted LED's for future mods
6,400 channel Mod. (Computer Controlled Only)
2 DB25 jacks mounted in rear.
2 25 cond. cables for Interface
1 9 Cond. Cable for interface
1 CE-232 Interface. Built externally in a very nice looking project box with a led on indicator, two DB 25 jacks to interface with the Scanner, 1 DB9 Jack for Comm. port connection to computer.
I Have all Original Documentation an As-Built diagrams of the Interconnection between the scanner and CE-232. The Analog to Digital conversion has been enabled and works Perfectly. The Ce-232 Documentation and installation and Operation software will come in a nice binded folder exactly the way I Received it from Commtronics Engineering (Bill Cheek) With the addition of all AS-Built diagrams that I have done.
I have been using a Windows program "Pro Turbo" with this scanner and it is quite impressive. I think that there is another windows based program called "Red shift" But I cant comment on that one.
This Scanner and Interface are in Absolutely Mint- Cond. Electrically and Cosmetically. I also have Full Copies of Bill Cheeks World Scanner Reports form Jan 1991 to July 1996 That I will throw in with the deal. I want $500.00 Dollars Firm plus UPS Ground shipping (I will properly pack it) If you need some specific information on the capabilities of this interface you can visit these sites.
Thanks,
Craig

Do most of these scanners with weather alert have a dedicated separate receiver in them, or do you have to tie up the whole box when you wish to monitor during severe wx?
Jason

My Uniden BC895XLT uses the same reciever i.e., I can not use the radio while it is in weather alert mode.

Couple of observations...
Most programmable radios manufactured in the last 10 years ie Motorola HT600 and 1000, or so have a feature that can be added called "TX inhibit on busy channel" If programmed in, it will do just what was suggested. I did not program it in my agency because most users of the system consider the radio just another piece of equipment and desire simplicity in use. Most radios would end up back on my bench marked "doesn't transmit all the time"
As for geographic spacing of repeaters, especially in N. Jersey where I am from, there is NO spectrum available and the channels are packed tight and heavily loaded. Just listen to 155.655 in that area. It would be desirable for every agency to have a sole frequency for a radius of 100 miles, but it can't be done until transmissions methods change and the equipment becomes affordable to the budget restrictions most agencies face.

Just my 2 cents
Mike

>

>Ken

You're not getting it.

The problem is that the cell system -- even good old analog cell -- uses the same channel for many different calls at the same time -- physically separated by distance. This is what the "cells" are all about. Different groups of channels (designated group A, B, ..., through G) are used by different cells. The channel you're on might be in use by some other phone, at the same time, in some other cell in your city. However that other cell will never be physically adjacent to yours. (In fact, not only are cells using the same channel groups never physically adjacent, cells using *adjacent* channel groups are never physicaly adjacent either. For example, all the channels in group B are one notch up from those in group A; therefore a "group B" cell will never be adjacent to a "group A" cell.)

Now, because of the way channel groups are assigned to cells, the cell system can assume that if a phone has been assigned a given channel, that phone's signal will be stronger in its cell than in any adjacent cell, and FAR stronger in its cell than in the "next nearest" cell that also uses the same or an adjacent channel group. The cell system's handoff mechanism utterly depends on this assumption.

A phone operating from an overhead location, where many cells are essentially equidistant from the phone, breaks this assumption. The phone might be lighting up several cells in the same channel group, EACH of which might ALREADY be handling a *different* call, but all using the same channel. At best, this will "merely" cause interference for those other calls. More likely, it will greatly confuse the cell system. It will appear that the phone travelled from one cell to another, non-adjacent cell in the same channel group, while somehow avoiding the cells in between; the handoff mechanism isn't prepared for this. The system will likely think that the same phone is in many cells at once, and so assume that it's been cloned.

Note that it isn't the cells out near the horizon that are the problem; it's the large number of cells that are more or less right under the airplane.

The flag probably wouln't appear unless the interference was so strong that it overpowered the bona
fide ILS signal, causing the receiver to stop receiving the signal it recognizes. A worse case
would be if the interference was more subtle and affected the signal slightly. Even a car too close
to the glideslope or localizer antenae (inside the critical area) can cause accuracy problems with
the signal, and it is possible that a stray signal near the receiver could do this too.

3230. Re: Discone Antenna

Newsgroup: rec.radio.scanner

I lived in a house for 7 years recently that did not allow outside antennas. I had 7 antennas installed in the attic. A discone for the scanner. A uhf/vhf log periodic for scanner. and 5 ham antennas. I used to call my roof a "RADOME". :) everything worked fine.

The obvious drawback is that you violate the 'higher the antenna, the better" rule by being at roof level, but as they say " all antennas work, some work better than others".

I ditto everything jimk2000 has to say about it -- same as my experience.

cheers

I have the following for sale or trade:

Motorola MT1000 - 99 channel, VHF, DTMF Keypad
Maxon SM4150 VHF, 16 channel, 40Watt, scan

Both of these units are in nice shape. Pics available upon request.

Will consider trades for MOTOROLA UHF equipment or
Cash offers. Please don't ask how much I want, do some research and make an
offer!

Thanks

Mike,
Just out of curiosity, how much usage does the national police freq., 155.475 MHz, get in your area? Possibly the radio could switch to this freq. when a user tries to double with another. Personally, I think that doubling is something non-trunked users will have to live with. As a former police/911 emergency dispatcher, most cases of doubling I observed occurred when two officers keyed up at the same time, and I don't think there is much that either training or technology can do about that on a non-trunked system. It may be that even trunked systems can't deal with that particular problem, I'm not familiar with them as trunking is not common here in Oklahoma. But 155.475 MHz is DEAD around here, there are only 4 licenses issued for it in the entire state, and 3 of the 4 are state agencies.

As of the last time I grabbed a copy, the pertinent rule of the FAA:

Sec. 91.21 Portable electronic devices.

(a) Except as provided in paragraph (b) of this section, no person may
operate, nor may any operator or pilot in command of an aircraft allow the
operation of, any portable electronic device on any of the following U.S.-
registered civil aircraft:
(1) Aircraft operated by a holder of an air carrier operating
certificate
or an operating certificate; or
(2) Any other aircraft while it is operated under IFR.
(b) Paragraph (a) of this section does not apply to--
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the operator of the
aircraft
has determined will not cause interference with the navigation or
communication system of the aircraft on which it is to be used.
(c) In the case of an aircraft operated by a holder of an air carrier
operating certificate or an operating certificate, the determination
required
by paragraph (b)(5) of this section shall be made by that operator of the
aircraft on which the particular device is to be used. In the case of
other
aircraft, the determination may be made by the pilot in command or other
operator of the aircraft.

Effective Date Note: At 54 FR 34291, August 18, 1989, Sec. 91.21 was revised effective August 18, 1990, as set out above.

Note that the 'operator of the aircraft' in secion 5 is NOT THE PILOT IN COMMAND. (Unless the airline has delegated that authority to him officially)

The 'operator' is the AIRLINE. Some airlines allow scanner operation in flight (NOT during takeoff/landing) Most do not.

I've used a scanner at airports, probably no problem. (Depending on the antsiness of the guards) Taking it thru security, you'll likely be required to prove it works. Or told to put it in checked luggage, or who knows what?

I have worked on Midland radios and I suspect the others are the same way, there is programming to stop radios from transmitting if the channel is busy, but most buyers have it turned off. There is also a transmitter time out feature that turns off the transmitter if a stuck mic happens after a programmable amout of time, but again is defeated at the buyers request. It is in the radios, if they choose to use it.

Brendan,

The replies I read on this newsgroup so far have not addressed your situation ... a building, possibly with concrete walls and metal reinforcement.

You MIGHT lose alot of signal with the antenna inside, particularly in the direction towards the opposite side of the building from where you live.

How high (or how many floors up) will the antenna be? Are there other buildings surrounding yours ... which might block OR reflect signals?

Doing some signal tests from the place you want to put the antenna, as well as from various locations inside AND outside the building (including from the roof), may give you an idea of how much signal will be lost with an indoor antenna.

Jeff Multer, Fort Mill, S.C.

Dave,
1) You shouldn't have a problem getting through security with your scanner. I haven't been through the New Orleans airport with mine but have been through the Shreveport airport with it. I have the Icom R2 and because of its size I was easily able to carry it in my pocket. When I had to take it out to walk through the metal detector the security guard asked, "is that a pager?" Then she asked me to turn it on, I guess to verify that it wasn't a bomb disguised as a pager. Then about six months later when I was passing through again I was asked if it was a cell phone. If any of the security guards had recognized it they might have reminded me not to use it on the plane. But I'm only guessing.

2)I've read on some of these groups that some airlines allow you to use them on planes but I don't know if this is true. I've only used mine while sitting in the airport waiting for my flights.

The reason they don't allow them on flights (along with any receiving radio, even a plain am/fm radio) is because of the slight chance of them interfering with the navigation systems, even though your scanner is only supposed to receive.

-Matt

Thanks for the comments folks. It seems that "busy channel lock out" or "busy channel inhibit" is available in a lot of radios. However I suspect that the concept needs to be tweaked/improved just a little bit.

One response that I received stated that a "double click" feature is available on Motorola Trunked Radio Systems. This feature allows a user to click his/her PTT twice rapidly in order to gain priority access to a busy talk group. Anybody know how that works? Does it just boot the other users off the talkgroup? (?Ruthless Preemption?).

If this feature was upgraded from a "double click" feature to a "death grip" feature, maybe it would be wildly successful. (Please excuse my macabre terminology).

A "death grip" feature would work like this - 2 cops are chasing a guy on foot down a road - the lead cop is calling the play by play - the backup cop spots a guy up the road with a gun so he needs to break in over the play by play - the following cop would mash his PTT - get 2 "busy channel" beeps - continue to mash his PTT - the infrastructure would move the transmit freq of the backup cop's radio to a clear freq and pipe it over the repeater simultaneously with the lead cops message - or the backup cops warning could be routed to a special dispatcher who would have to jump in on the conversation. Or something like that.

I will have to try to figure out if this will work on non-repeatered and repeater channels. Basically what I am thinking about is a "anti-double" device combined with an "emergency override" feature. The million dollar question is - Is there a fatal flaw in my concept somewhere?

Peter S

Yes - yes - yes - 155.475 might be a very useful freq in this scheme. Possibly a special narrowband freq might do the trick also. Or a bunch of them.

I have a Nokia 6160 (top of line) cell phone with calendar, address book, memories, reminder function, etc., and about $400 worth of accessories, to trade for any type of trunk tracking scanner (base, portable, etc., doesn't matter).

Phone is in top notch shape and need only be activated to start using - I just no longer use it.

If interested, reply with info on scanner (or scanners), and I'll send a list of everything that comes with the phone (leather holder, mobile ant, batteries, hands free mic for driving, and more....) - the list is too long to post here...

John

Sorry, I did not read your posting close enough and Jeff is correct. If you are talking about a commercial structure/building then the conditions could be quit different from a residential structure which is what I was refering to. Concrete, metal and possibly the roof tile (depending on what type of material it's composed of) could be a factor in how well you receive any signal. You need to some how temporarily position the antenna outside and then compare with it in its current placement.

If I was to sell my old Pro-34 on eBay what would it be worth? I
mod'ed it years ago to include cellular and changed out the oscillator
crystal so it would scan faster. It's a little scratched but otherwise
works fine. Is $50 fair?

JOHN T. DOOLITTLE
August 07, 2000

Dear Norman:

Since experimenters first began charting the newly discovered electromagnetic spectrum at the turn of the century, Amateur Radio has been a place where the capabilities of new electronic circuits and techniques have been explored in the American tradition of the citizen-scientist. Access to small portions of the spectrum has allowed Amateur Radio to nurture generations of scientists, broadcast professionals and electronics specialists, many of whom play key roles in today's telecommunications revolution.
Even more widely recognized is Amateur Radio's emergency and public service capacity. Amateur Radio provides a valuable, and sometimes life-saving, public benefit. Indeed, as the nation's telecommunication infrastructure becomes increasingly complex it also becomes increasingly important to have a simple back-up service like Amateur Radio available in the event of serious disruption.
Together with my colleagues in the US House of Representatives, I have made a move to continue the traditional support of the Amateur Radio frequencies with HR 783, the Amateur Radio Spectrum Protection Act. HR 783 would require the Federal Communications Commission to provide equivalent replacement spectrum should it ever be necessary to reallocate Amateur Radio frequencies for some other purpose.
As a cosponsor, I aim to further the cause of the individual amateur radio operator, keeping HAM frequencies from being eclipsed by newer technologies well into the 21st century.
Please feel free to contact my legislative assistant, Scott Bryant, if you have any questions or concerns related to this legislation or any other issue.
Sincerely,
John T. Doolittle
United States Representative

Many times in our lives we do things before we think. My response to Daniel Conti's posting to my request was harsh and at least uncalled for on the news group. Instead of posting it here I should have E-Mailed Mr. Conti directly. I apologize first to Mr. Conti for my rudeness and poor judgment in making my reply for all to see. I apologize secondly to the users of the newsgroups involved for using this space for an outlet for something I myself discourage (Flaming). Like I noted in that post, there are people who are involved in many aspects of radio, some of which may hold useful information someone needs but does not subscribe to the "exact" newsgroup it would fall under. I myself am a Ham operator/scanner & short-wave enthusiast but I don't subscribe to any ham related groups. I expanded my search area to short-wave in hopes of finding someone who could help me but maybe didn't subscribe to a scanner. Enough of the BS, apologies all the way around.....Let's all keep in mind that sometimes people do look in nearly related places for related info to what their looking for.... Sorry for the mega-flame Dan.

Dave

I just bought a nice Comet dual band 144/440 antenna and mounted it on my Ford Bronco. It is not much longer than my Ford radio antenna, so it goes in and out of the garage OK. used a Larsen mount that screws into the top of the fender between the edge of the fender and the edge of the hood. Mount is pretty unobtrusive and out of line of vision pretty much. This is a great antenna. I can e-mail additional information and a picture if you want. 73

Hi All,

It appears that United Airlines is getting ready to go live with a Motorola Trunking System at Oakland International Airport. I remember seeing a posting somewhere a few months ago (could have been SCAN-L or rec.radio.scanner) about someone finding a couple of Motorola Control channels on two Ramp frequencies at Baltimore International Aiport.

Has anyone else discovered this at other United Airlines hubs?

The following information was sent to me yesterday by another member of the Bayscan list:

FCC Lists the callsign WPMV365 and specifies the following frequencies

460/465.6750 MHz
460/465.7000 MHz Control channel heard on Saturday
460/465.7750 MHz Control channel heard on Friday
460/465.8000 MHz Control channel heard on Sunday (today)
460/465.8750 MHz

Licensee is United Airlines.
Syatem ID: 742b.

I have no idea what the current Base and Offset are for this system.

Does anyone know how to determine the Base and Offset for a Motorola System in the 460 Mhz band?

T.I.A.

Bob

Check out the following FAQ:

http://home.att.net/~wwhitby/tt_ids.htm

There's a section about 2/3 of the way down the page titled

Determining Base and Offset Frequencies for the BC245xlt

The steps described in this section should also work with the Pro 94.

There's also a section titled Federal Trunking Frequencies.

3269. whats the deal with cellular?

Newsgroup: rec.radio.scanner
Date: 2000-08-13 00:00:00 UTC
From: Yizeguy@webtv.net
Message-ID: <18363-39977A2F-127@storefull-104.iap.bryant.webtv.net>
Source record: 82365

why do people still care about listening to cellular?

most all the listening that can be done is now analog only, and 90% is now digital and cant be heard anyway.

aside from that, its just plain uninteresting anyway. i will admit a few years ago there was more traffic out there and occassionally there was a gem amongst all the crap. but now ? who cares? theres nothing there anymore!

perhaps its a matter of principal. just having some band taken away that is free to monitor in other countries. i admit that kinda pises me off to.

so whats the big deal?

the reason i ask is i have a scanner for sale that is blocked, and people email me saying they dont want it for that reason, after they find out it is a later unrestorable model.

> SNIP

That's not what I wrote John. I said

"Well the vote so far is hate John-Corky Mackey 6"

You changed it John-Corky. In denial once again. I say John-Corky and you heel.

Now, how come you ignored this other revelation? Oh yeah. It exposed ANOTHER John-Corky LIE!

> Glenn - I guess if I have to chose one or the other then I have to take
> hating YOU!

You have already been counted Corky-John. It's now people who posted they hate John-Corky Mackey 46 Glenn -3

> > People who have posted they hate John- 43

That's not what I said liar John-Corky. How low will you go?

> How do you figure 43 when there has only been about 3 or 4??

46 moron. There are actually more, I am only counting people that have been around this group for a while. Not votes against me though, or you would be back to two, you, John-Corky and your luv RicK-Corky. How sweet. Is RicK a PARG member or just a PARG groupie?

Starting? I do not know of any hospital in Cincinnati that allows cell phones to be used inside. My wife is a RN at Children's Hospital here. There are signs that tell you to turn off your cell phone at the entrances.

Anyone compiling a list of freqs for the Democratic Convention?....I saw on the news tonight that the CHP is in charge of security for a couple blocks of downtown (major hotels, etc), and they have brought in a large number of assets from Northern California. The spokeperson stated that patrol staffing levels are 50% higher than normal in the LA area... LAPD is already on tactical alert, meaning 4600 officers on duty at any given time. I don't have a number on the LA Sheriffs, but do know that there are 30 or so cities in the county that have promised 10 man/1 sgt strike teams if necessary.

And 3000 National Guard troops tucked away in Los Alamitos.

3273. Re: Antenna in Tree (hidden from HOA) - do leaves interfere with re...

Okay heres what i did and it worked!

I did two things to beat the HOA's.
The first time i had a upper balcony. I filled a big plastic pot with cement and placed a 6 foot pole in the center. I then mounted a discone on that and it worked quite well. Made a nice Christmas tree during the season (kidding) There rules were "nothing attached to the balcony".I was able to move it in and out as necessary.

Definately need the best coax I use LMR-400 flex. not to expensive and bends easily.
low loss.

The second place we lived was after the quake, and since i was a ham operator, i went to them and said "I am a federally licensed ham operator and i can provide emergency communications during an emergency even when all phones and power is out (which it was) and i can talk all the way to nevada on my battery back ups" I can provide a valuble service to you. Perhaps save someones life! And it wont interfere with tv sets. they then said what do you need to do it...ohh a nice discone and a tri band verticle will do nicely. its dosent look to bad either. I showed them in a catalog what they weighed and looked like. a week later they gave me a hand putting them on top of the building.
so my advice...be a ham, not to hard to do either. and do your thing for public saftey. (and hobby)

Message-ID: <ihvl5.5820$IH.245468@newsread2.prod.itd.earthlink.net>
Source record: 82403

Hi all,

Years ago I used a Pro2006 to decode data. It was very selective and worked well. Since so much time has passed I was wondering what the group thought was the best current scanner from RS? How does it compare to the old 2006? As selective or not?

Thanks very much.

MD

The image is TWICE the IF away from the transmitted frequency.
Therefore, the calculation would be 182.2 - (2 * 10.8) or
or 182.2 + (2 * 10.8), depending on whether the receiver
employs low or high side injection.

Have you tried monitoring the SPEN channels.Many agencies in Middlesex and Monmouth counties use these frequencies for just this purpose. You might also try the talk-around freq. from the old 460 system. There were several agencies using 465 split channel for undercover work.

Bruce,

That's an interesting observation. My IC-R8500 is located in the
basement.
When I use the ICOM software (ver. 1.0), the computer is located in a
different
room so I cannot view the IC-R8500's front panel when it's under
computer control.

One problem is that the software appears to have a "memory leak" when
you display a certain combination of windows. I don't recall the
configuration.
Sooner or later, it can cause my PC to run low on resources.

Also, the IC-R8500 scans slower under software control than its maximum
40 ch/sec. rate.
The software lacks a print function. Otherwise, it's a pretty good
implementation.

anyone have a list of frequencies active around the Staples center in Los Angeles?

I have found activity on media frequencies in the 450.00- 451.00 and 455.00-456.00 range.
I believe ther eare also some media frequencies in the 160.00-161.500 and 172.00-174.00 range

also, there are wireless microphones in the 174.00-216.00 range.

what is a good source of permanent mount (not magnetic) auto antennas... I drive a F-150 pickup and have a few magnetic antennas on the roof.... I'd like to get three or four permanent antennas...
one antenna for CB, one for 2M/440, one for low band and one for high band (for the scanners)

One person remarked that my truck is amobile communications center with all the radio equipment I have
three Scanners, CB, and soon 2M/440 also.

I am in either the Phoenix Az or Glendale Ca areas

I have just bought an Icom PCR 1000 scanner, but know absolutely nothing about scanning.

Is there any place that I can be directed to in order to read up about the difference between AM/FM/USB etc, what are memory banks, how do I find interesting frequencies, etc

I know it is a very broad section, but I am sure that here must be web sites that provide all these answers.

3295. BC245 trunk problem: 'data' icon

Newsgroup: rec.radio.scanner
Date: 2000-08-13 00:00:00 UTC
From: buckaroosd@aol.com
Message-ID: <SKzl5.150$xg1.19995@news1.rdc1.sdca.home.com>
Source record: 82421

My BC245 has been working flawlessly tracking City of San Diego trunked freqs for months. However, it suddenly has begun displaying the 'data' icon (with the slash through it) and I can't get rid of it. Have tried simply pressing the 'data' button to no avail. Any insights on how to get rid of it? New frequencies? If so, any ideas what they are? I'm having trouble finding any new ones. User error?

Thanks in advance for any tips.

You have inadvertently turned OFF the disconnect tone method of determining when a trunked call has ended. Chances are you notice that there is now a 'squelch tail' on the end of trunked conversations? To turn the disconnect tone method back on, just hit the SVC key while the scanner is stopped on a trunked conversation or ID and the scanner will beep once and that data icon will go off.

How you got into that mode is that you hit the SVC key while you were monitoring a trunked ID (the scanner would beep twice and that data icon would start blinking). Then on further trunked conversations, the data icon would remain on. It's an indicator (believe it or not) that the disconnect tone method of determining when a conversation is ended is not being used. I don't believe that this is documented in the manual.

The whole reason for having this ability is that sometimes if you are in a very strong signal area, the scanner can be fooled into 'thinking' that the disconnect tone has been generated and thus leave a conversation prematurely. With the disconnect tone turned off, the scanner will only leave a conversation when the actual RF is dropped at the end of the conversation. I am very close to a NJ state police base but I have never had a problem with the disconnect tone method. I like it a lot since the conversations end 'very softly' with no squelch tail.

Jason,

I could be wrong on this but I believe Bill Cheek's (no flames please) CE-232
was wired into the scanner to simulate user key pushes and possibly read
the display on scanners. Although Bill is gone now, his web page is still
active and his wife may be continuing his business.

http://www.comtronics.net/0_oview.htm

Someone else on this NG who has actually used one of these things might
be able to give you more information.

Has anyone ever tried to figure out a way to read and write to a scanner that is not able
to be computer controlled out of the box to program it? I know it can be done on other
radios.

Jason

3298. FS/FT Scanners

Hi all,
I have a few scanners for sale-

Uniden BC200XLT (unblocked), extra battery pack, rubber duck. Near perfect condition. Make an offer.

Pro 92 (1.00 version), software, cable, original box, manual. This radio is in PERFECT condition! Only turned on twice. Make an offer.

Pro 2046 radio is in pretty good condition. No scratches on face or screen.

Pro 26 Radio is in alright condition. Does not 'search' correctly. Case has small hole cut into it (from mod that didnt work). Scans perfect. Other than the search function this in a GREAT radio.

I will only ship in CONUS. Please make an offer.

Jim (KC7RYD)

I prefer portable PC Compatible Scanners like Uniden's BC 245 XLT, AOR AR8000 with Optolinx Interface, Yupiteru's latest MVT line or even Uniden's Base/Mobile BC 895 XLT or any of their latest updated PC Compatible versions as opposed to an Internal PC unit like the Winradio because you will get much more use from a versatile, independant scanner when it's not tied to your noise generating PC which will also tie you down to a desk that's not so portable.
Any scanner that is able to be run and analyzed by freeware or pro software by computer will be favorable to own and use under many situations and circumstances whether you're on the run or feel like relaxing to a beer while you're sitting at the workbench figuring out all of your scanner's capabilities and possibilities by PC.
Of course, half the fun is making sure you have a good antenna or several antennas to compare and maximize your efforts when looking for and monitoring useful, active frequencies locally, distantly, and DXally.

Are you really John-Corky? You are just like him. You didn't need to vote
Rick-Corky, I already counted your vote. You SNIPped it just like John-Corky
SNIPs. What a couple!

Here, again for John-Corky and RicK-Corky.

I wrote and RicK-Corky SNIPped" 43-01 or if your luv Rick or RicK votes
43-2"

But two more in the last 6 hours voted against John-Corky so no we
have.....

45 hate Corky-Mackey/RicK Mackey

2 (John/RicK MacKey) hate me.

You should have learned from your twin brother Corky-John, Rick-Corky.

Glenn

Numerous people, including myself, have both questioned if you are
actually a member of the human race, and if so, to leave the human
race.

There. Proof positive that you are a liar.

155.475 is used pretty heavily around here. Most agencies use it as a "chat" channel between cars and car to base.
Doubling really is not much of a problem. Usually one wins out over the other and the dispatcher can usually tell the identity of both users.

I read a review on it, and it sounds like it may be a better scanner than a shortwave receiver...and maybe not the best choice in scanners either. The display was claimed to be somewhat fuzzy, and had to be view straight on. The overall performance of the radio was not worthy of it's high price.

I'm well aware of that.

>The result is the if you are 5 miles directly over a BTS, it is not
>likely the cell would notice you. The BTS is essentially deaf looking
>more than 70 degrees above the horizontal.

I also know that RF is damned slippery stuff and rarely does exactly what
you want it to under field conditions.

The fact is that many people HAVE reported their cellphones *working* from
five miles up... for brief periods. If you can light up one cell site
then you can light up several others, and some of those will be in the
same or adjacent channel groups to yours, with all the problems that that
entails.

Conversely, it's going to be pretty strange circumstances when a modern
handheld phones hits cell sites all the way out at the horizon from five
miles up. Your phone may well be able to hear the cell site but... the
other way around??? On 0.7W max for analog, less for digital? Unless I
have my facts mixed up, the 3W outputs went the way of the bag phone;
certainly my little Motorola StarTac can't put out three watts!

This is how they are adapting to their budget cutbacks (which is a load of crap anyway).
Here in the Concord, N.H. area we have the broadcast from Gray, Me. and it is a human voice except for the automated data I.E. buoy reports, current conditions from ASOS, time, id's, etc. Knowing that Sven is going to be the only thing that we will hear in the future, is a nice chance to adjust both for the NWS and the listener.
Down in Taunton, Ma they had quite a bit of fine tuning to do. I think that they had Sven running in house for six months before they let him go out in public.

Your other option is to try the image frequency caused by the if.
Lets assume that you have a RS scanner with a 10.8 MHz if...

Freq. 182.2
IF 10.8

Difference 171.4

So, by plugging in 174.4, you might hear it. Also try 10.7. There are other
if's, but I don't remember them.

Hello Glenn. You and other taxpayers in your state, county, and city should band together to keep any police department from going digital. This may sound radical but anytime you cannot monitor your police department you are one step closer to a dictator ship. That new digital system will require the scanner producers to come up with cheap, but good quality, receivers for the listening public. Fight It. N9IPA

USE the EF Johnson! Its the best sounding commercial speaker I have ever heard! I use one with my Motorola Commercial radio. They are also 4 ohms....alot of the motorolas are 4 and some are 8...it makes a difference. I use the EFJ because it sounds so natural, and you don't need alot of volume...sounds like what you need. You can find one at a Ham flea market, or on ebay. I saw a EFJ fleetcom complete with the external speaker (800 mhz radio) for 10 bucks. You could use the radio for a wheel chock and the speaker for your scanner...unless you LIKE fleetcoms...in which case I can sell you about 100 of them!

3348. AR 8000 B questions, new owner

Newsgroup: rec.radio.scanner
Date: 2000-08-14 00:00:00 UTC
From: Charles Patterson <charles@telephonesecurity.com>
Message-ID: <8naebegia1@sshuraac-i-1.production.compuserve.com>
Source record: 82255

I just got an AR8000 B, so while I have been observing the AOR stuff for a while I'm now an owner.
I would like to find some good web sites or mailing lists for the ar8000.
Are there good mods for the 8000B? (can it be unblocked?)

thanks
Charles

3349. Bearcat BC 250 needs repair

Newsgroup: rec.radio.scanner

I have an old Bearcat BC 250.
The display only shows a single red dot in the lower right and doesn't receive anything.
I already replaced one power transistor on the display circuit board but that isn't enough to get it working.

Is there a source for schematics for this old scanner?
(any other thoughts or advice appreciated).

thanks

Are you aware that there's a resistor in series with the
earphone jack?

You can bypass it by shorting the speaker plug ground to the
antenna ground. It increases the volume a little with an
external speaker.

Sorry guy, but all communications are going digital over the next 10 years.
It will then be very easy to use encryption so no one can hear the
transmissions. It is a fact of life and we will just have to learn to live
without listening to public service, especially police channels.

Hi Everyone:

Yesterday I had a phone conversation with my cousin who is State Trooper down in Little Rock.
He told me the State of Arkansas is going to completely overhaul their radio system by late 2002.
The new system according to him will use "Project 25" technology from Motorola. The system
will be phased in Troop by Troop across the state. He said the current system is outdated, and they can't add any large number of new users to it.

Will any of the newer Trunktracker scanners from Uniden be able to decode this new radio system, or is everyone like me out of luck? I have a BC-895XLT which does just fine now, but my cousin says it will be useless in 2-3 years.

Thanks,

Glenn

Although the Good Colonel would like it by 2002, 2002 is when it
will finally go to bid. System completion could be as late as 2005 or
2006

Right now, the system is being upgraded into a type II system,
forcing local government to upgrade now, and then again in
4-5 years.

Re: http://www.latimes.com/editions/orange/comment/20000813/t000075875.html

Time for a "Reality Check" here??? Let's see:

- at least $80 milllion county tax dollars

- a system that "may not work in some clusters of buildings" according to Motorola

- bi-directional amps installed and, presumably, paid for by building owners to essentially help fund the county system so it works right

- and/or passive antenna systems installed and, presumably, paid for by building owners to help fund the county system so it works right

- police and firefighters will need a map or list (or luck) to figure where they may or may not be able to depend on their radios. ("Um, excuse me, Mr. Hostage Taker, my new radio doesn't work down here. Could you move your victims out of this basement, or over to Santa Monica, so I can call for help?"

- "King's X" - it's not Motorola's fault, it's because of all that seismic retrofitting and even had the audacity of putting up new buildings

- here we are, in the 21st century, with cellphones and pagers on everyone's hip, but according to an OC Communications person, "any indoor coverage is a bonus" with the new radio system because the 1970's UHF system was accepted with a "mobile on the street" coverage guarantee. (I don't understand the logic of that. And is there no longer even "mobile n the street" coverage" on the UHF system?)

Is this PROGRESS? Give me - or rather, give the users a break! I bet a small fraction of that $80 million could bring the existing UHF system absolutely up-to-date. If it works right to begin with, who needs stuff like "fail-soft" and back-up compuetrs, and all the other fancy bells and whistles that Motorola and their salespersons makes a fortune on with every one of these "systems" they sell.

I doubt it's TALL buildings that have problems,
it's the wide low ones, and ones with multiple basements.

But that's easily overcome with passive antenna systems.

"Harry Marnell" <marnells@snowcrest.net> wrote:

>- at least $80 milllion county tax dollars

It ain't cheap. The longer capital upgrades take place, the more expensive they are. That's my mantra at work, but when your administration prides themselves on their fiscal austerity policy, the motto changes to "MT-500s Forever." (even if they are held together with Scotch 33+.)

>- a system that "may not work in some clusters of buildings" according to >Motorola

Before we resort to hysterics and emotions, in what fashion does this not meet the performance of the UHF system?

>- bi-directional amps installed and, presumably, paid for by building owners >to essentially help fund the county system so it works right...
>- and/or passive antenna systems installed and, presumably, paid for by >building owners to help fund the county system so it works right

Most new construction ignore the requirement to communicate inside the facility. Even with VHF or UHF, there is only ONE sure way to cover the building - that's not to put the antenna on top of it (amazingly the most frequently implemented solution that usually yields great signals for hundreds of square miles, but none inside the building), but to use both Radiax, power dividers and a network of distributed antennas in addition to energy "beamed" at the building from the exterior.

Is there an ordinance requiring retrofitting or BDAs in new construction?

>- police and firefighters will need a map or list (or luck) to figure where >they may or may not be able to depend on their radios. ("Um, excuse me, Mr. >Hostage Taker, my new radio doesn't work down here. Could you move your >victims out of this basement, or over to Santa Monica, so I can call for >help?"

Basements are equally bad for trunked and conventional systems. Good on-site communications practices should employ simplex (non-repeated) frequencies during fireground and tactical communications so that units can communicate directly from radio to radio. IMPO, if the system was constructed entirely dependent upon the trunked system infrastructure, it should not be used for public safety applications until simplex channels have been incorporated and personnel trained in

using it in tactical environments.

>- "King's X" - it's not Motorola's fault, it's because of all that seismic
>retrofitting and even had the audacity of putting up new buildings
>- here we are, in the 21st century, with cellphones and pagers on everyone's
>hip, but according to an OC Communications person, "any indoor coverage is a
>bonus"

It's next to impossible to predict how well a system designed for
streetside coverage will penetrate into a structure that's not under
control of the local entity building the system. Most of the time,
when someone is interested in indoor coverage, either a test is
performed and the signal levels plotted inside or the building is
wired for a BDA. Metalized windows, rebar, metal drywall studs and all
of the rest of the common highrise and office construction practices
can turn the building into a big screen room.

>with the new radio system because the 1970's UHF system was accepted
>with a "mobile on the street" coverage guarantee. (I don't understand the
>logic of that. And is there no longer even "mobile n the street" coverage"
>on the UHF system?)

I've never been to OC, so I can't comment on effacacy of the old in
comparison th he new. What I don't understand is why anyone would sign
off on a system that does not meet standards outlined in the RFP? OR -
why anyone would design an RFP that is warranteed by the manufacturer
by acceptance and then allow someone else - or the manufacturer to
perform the system audit.

>Is this PROGRESS? Give me - or rather, give the users a break! I bet a
>small fraction of that $80 million could bring the existing UHF system
>absolutely up-to-date. If it works right to begin with, who needs stuff...

It's only progress from the standpoint of spectrum efficiency. There
is no reason (given a clear set of UHF frequencies) that trunking
could not have been implemented there. It's important to consider that
if the present UHF system "works" right now, co-locating several
transmitters together using combiners will reduce the ERP
significantly, so it may not work that well afterwards unless higher
power is used to overcome losses.

Not to defend something that may be poorly constructed, but it takes
two to tango and the story seems a little unilateral.

Isn't Los Angeles County Fire also on frequencies in the 470mhz area.. I've heard them there as well as on the 153 and 154mhz frequencies. I travel between Phoenix and southern California and often have two scanners with me..... Often, the Phoenix frequencies are active in southern Ca too.... 154.19, 154.28, and 154.37 are quite active almost any place I've been.... even in the San Francisco area.

LA City Fire uses frequencies in the 856-0-860.0mhz area.

Could you kindly share your experience with me?
Does anyone have experience with Rayovac Renewal Rechargeable Alkalines
batteries?

They are beind sold at auction. It looks like a good deal!
http://page.auctions.yahoo.com/auction/36893805

I look forward to hearing from you. Thank you.

I wouldn't be so sure about those numbers you cite. But even if it
were true, 10% of the daily cell phone traffic is still an awful lot
of traffic.

>aside from that, its just plain uninteresting anyway. i will admit a few
>years ago there was more traffic out there and occassionally there was a
>gem amongst all the crap. but now ? who cares? theres nothing there
>anymore!

How would you know unless you were listening?

Anyhow, you probably already know that what you hear depends on where
and when you listen. If you listen in a business type area, I'd
agree, most conversations are pretty dull. If you're listening along
a major interstate highway, however, you'll hear a more fascinating
cross section of people.

>perhaps its a matter of principal. just having some band taken away that
>is free to monitor in other countries. i admit that kinda pises me off
>to.

It shouldn't just piss you off. It should make you mad enough to
write to your representation in Congress, Parliament, whatever.

>so whats the big deal?

The big deal is that the classic concept of radio secrecy, the
paradigm of the first century of radio, is being replaced by an
ignorant foolishness called "radio privacy." This new paradigm might
as well be called the Emperor's New Clothes for all of its
practicality.

>the reason i ask is i have a scanner for sale that is blocked, and
>people email me saying they dont want it for that reason, after they
>find out it is a later unrestorable model.

Now you know why. You have some brain damaged gear. I'm sorry you
had to discover it the hard way, but I'm sure you won't make the same
mistake again. Good luck.

The plain 92 uses sub-audible tones to figure out the trunking on Motorola systems. Due to various reasons, this causes it to leave some conversations before the actual conversation is done. The 92A uses the control channel instead of sub-audible tones to control it's trunk tracking. This is normally the better way to do it, but the 92A (and the mobile version 2067, both of which have the same firmware) completely misses some conversations for some reason (the problem you wrote about). So they still have work to do in my humble opinion.

I tried two different 92's, and a 2067 (after they went on sale). Returned all of them and got a BC245, which is much more satisfactory, even with it's 5 second trunk delay.

>
> Page 29 in your manual.
>

As I enumerated in my reply to 'Buckaroo', his problem is not covered in the manual under the 'data skip' section on page 29. It is an undocumented 'feature' which makes it possible to turn on/off the disconnect tone method of determining when a trunked transmission has ended. With the 'no data' icon on (steady or flashing) it doesn't use the disconnect tone to determine when a trunked transmission has ended. With that icon off, it does use the disconnect tone. This is toggled by hitting the SVC key (not the DATA key) while stopped on a trunking ID or conversation.

There were actually at least two readers of this newsgroup who benefited from this knowledge. Buckaroo and another fellow..:-)

Hi All,

Visit SWLINKS today, here:

http://swlinks.webalias.com

Now includes a listening post with archived Seattle-area scanner files (advantage - most of the boring stuff has been edited out!), including two trunked 800 files (20-30 minutes apiece) recorded on a Friday night, NOAA weather KHB60 (162.55 MHz), non-trunked Seattle-area scanner, and Aircraft band.

For shortwave aficionados, there are a couple shortwave audio files as well, with more on the way.

Enjoy,

W.

John,
I would suspect that the difference here is that the EMS transmissions come from an antenna on the roof of the hospital, i.e., physically remote from the equipment in the ER, ICU, CCU, etc.

Ken,
All I can say is that radio transmissions (by police and fire personnel) are forbidden in our ER, etc. It may be that the hospital personnel are briefed on areas where they can and can not use their radios. Proximity to certain areas such as those mentioned above may be the determining factor. The staff can be taught where it is safe to use the radios whereas outsiders might not realize they are in close proximity to sensitive equipment, hence the blanket ban. This is just an educated guess, I don't know for sure. I do have some friends on the maint. crew at the hospital, if I can find anything out I'll post it.

My take on it is a person wants a scanner who picks up alot of transmissions. With alot of trunking advancement you can pick up less with a regular scanner. I live in a big city. Not that I listen to them-but there is always something to listen to. Besides they don't make scanners like this anymore. Anything that becomes scarce will grow in value usually.

3394. Fraud Alert - JASON WEBB

Newsgroup: rec.radio.scanner
Date: 2000-08-14 00:00:00 UTC
From: slvbeard@netzero.net
Message-ID: <8F90A379Fslvbeardnetzero@204.181.81.113>
Source record: 82338

This is a notice to anyone who may have had any dealings with a JASON WEBB (swflatrunking@gulfaccess.net). He had a post here on the Newsgroups and also on the Strong Signals For Sale Board for an AR8200 MKII scanner for $300. I worked a deal with him via email and got his mailing address in Naples, FL and sent him a postal money order via USPS express mail in the amount of $300. He said he would UPS the scanner to me on the following business day and email me a tracking number. He also called me on the same weekend on my mobil phone and said he would ship the scanner on Monday.

Well, over 2 weeks later, and no word from JASON WEBB or any sign of a scanner. I checked the USPS tracking site and the money order was signed for the next business day after I sent it.
He said he was leaving the country, which should have been a sign right there, and which also
explains why his email address is now dead.

I am going to look into pursuing legal action with the Postal Inspection Service.

I'd be curious if anyone has any dealings with this person, or knows the guy personally.

Live and Learn,

Adam

Depends where you live. Digital is useless in a huge percentage of land area in the US. Anywhere outside the top 10 or 15 metro areas, Digital & PCS barely cover the interstates. So in many, many rural to not-so-rural areas, all the traffic is still on analog cell channels.

On the Pro-92, you can set the Priority channel as the WX channel and it will check it for the necessary tone.
It will then stop scanning and make an audible alert (not that loud) and display "Weather Alert" or other info on the screen.

From: Kwon2m@worldnet.att.net
Message-ID: <39973f21.3707845@netnews.worldnet.att.net>
Source record: 82369

Has anyone heard exactly what the difference between a PRO-92A and a PRO-92 is SUPPOSED to be? Any word from the Shack as to what the new firmware really does for us? I bought a 92A recently and from what I can see, it does not have the trunk ID flicker problem reported in the 92, but seems to have trouble detecting the ID from time to time. I'm just curious what the real difference is supposed to be.

A couple of suggestions: First, determine if the area in which you live "requires" a trunk tracking scanner. You don't want to get her one that won't pick up the local action.
Second, check out ebay auctions - I've noticed some great scanners recently.
Good luck!

Here is Milwaukee Wisconsin we have the "Dot" syndrome. Alot of times (especially during severa weather times) you'll hear something to the affect of the following:

"Showers & Thunderstorms will continue accross southeast Wisconsin" "Dot" Some of these storms will produce Heavy Rain & Hail"

It is hillarious to listen. I presume the tech (Or whoever types the messages for this voice) in has to follow the guidelines similar to HTML. Anyways...its a hoot

John, be careful if you mount the antenna on the roof.

I mounted a Diamond dual bander (770NMO) to a NMO mount on the roof of my '97 F150. it is fine for highway but in the city beware of low hanging trees. I noticed one day my antenna was crooked so I took off the antenna and noticed the sheet metal was bowed up. Like if you took a screwdriver to a can of corn!
I took it to a friend of mine who is a installer of two way radios and he fixed the problem by bending it back CAREFULLY
he also told me it was my mount that did the damage.
So I got a larson MNO mount with a large base to cover the mount with more surface area, there fore more resilient to low hanging branches.
Now if the home owners trim their branches or there are no trees around by all means drill the hole but make sure they are at least a wavelength apart from each other to avoid problems with desence and the like

but if you have trees I would stay with a mag mount
I would rather buff a couple of scratches and replace a antenna whip than pay to have a hole plugged and repainted. I learned this the hard way.

thanks for your time
hope this helps if not well then sorry!

the real difference is the firmware version change from v1.00 to 3.25
in version 3.25 it trunks using the control channel as apposed to sub-audible
data
there are some other changes but nothing major

Only the pro-94 and newest can track Ericson.....and you must have the
logical channel numbering for it to work right.

Mark wrote:

Seems to me thats it a toss up between the AOR 8200MKII and the Yupiteru MVT-9000 II. I've been asking the same question, and have heard that the MVT9000 is better in the shortwave area then the AOR. Also the MVT9000 has a refreshing silver case and comes with a built-in speech descrambler, however it lacks the computer control. The MVT9000 is also about $100 USD less then the AOR. If you could somehow combine both of them it would perhaps be the greatest scanner. What I would like to know from everyone that has a scanner, how often do you use the computer control feature? Right now I have a RS PRO-64 and I feel like I'm missing out on the whole computer controlled scanner thing.

According to Rich Wells Web page the Pro-94 can only Trunk Motorola
and Ericsson Systems.

http://www.strongsignals.net/htm/pro-94.htm

From what I've heard, the Pro-94 is basically a BC245 XLT, but with more
channels (1000 for the Pro-94 vs 300 for the BC245 XLT).

Got news for you. No one in their right mind is going to pay $6000 each for a hand-held radio except for maybe our insane, money
conciousless government.
Oooops, sorry, accidently fell on the $6000 radio and broke it while chasing down a suspect. Oh well!

That's why I got my new 5Khz to 2.6Ghz scanner so that when they make them illegal, I'll be set
except for receiving all the remaining satellites at higher freqs. I'll just make a digital signal to PC decoder
or something. No biggie unless its encrypted, which it should have been to start with, years ago if it was such
an issue.

Who told you that about canadian scanner laws ?

Here in Canada, you can have a scanner and even listen to cellulars as opposed in the states. The only thing you can't do, is repeat what you heard on air. Like if your neighbor call the police to complain about you, you should not use it after against him. Just act as if you didn't hear nothing.

No good reasons needed to buy one. As opposed, a towing business doesn't have the rights to have one in the truck because it 's not fair for competitors. It's the only restriction I know.

There's no certification for scanner here, only for Ham radios.

Too bad my BC245 can't listen to cellular bands but anyway, it would be difficult to follow a conversation as the technology is cells.

The man walked on the moon, so I should be able to create a scanner for digital communications devices.

Martin... ever hear of encryption?

A big part of the motivation for going digital is to be able to easily
encrypt the data (whether that data represents voice or MDT traffic,
doesn't matter).

Sure, you can build a scanner that will pick up the transmissions and even
demodulate them to a digital data stream. But if there's nothing in the
data stream to give your scanner the complete decryption key (and there
won't be, in any reasonable system), the result will be garbage.

I'm trying out the Winscan computer control program for my 895 - but can't get it to work... The program keeps saying it can't locate the scanner, and asks if the scanner is in remote mode?

I can't find anything on putting the 895 in 'remote mode'....

Any help?

Thanks,

Press and hold the "alert/rmt" key down for 2 seconds while your scanner is
on and scanning. This will put the scanner in remote mode.

Just a quick comment on Bob's note on UPS COD. THEY ARE VERY SLOW !!!!! it took me on the adverage of 15-45 days to get a check (from UPS) on at least 5 transactions, I always ask for refrences and just ask potential buyers to ask about me. I always do a Postal MO it's still one of the safest methods of money in the mail.

So that's how you're trying to describe suppressing the truth about you,
Toilet Boy? You can keep trying to emulate your Nazi propaganda heroes,
but you're out of your league there. You lack the intellect to
understand
their methods.

Here are a few pieces of evidence for you chew on, Toilet Boy. This should keep you frothing for a while. You know the rest of the evidence exists; this is enough to prove my point. You are a liar and a fraud, Toilet Boy.

To your dimwitted friend Larry Johnson, two things:

First: Not only is the emperor wearing no clothes, but he's wearing last year's fashion.

Second: Go commit intrapersonal intercourse.

Do you really want to know, Toilet Boy? You can buy the information, if you have the courage to face the truth.

Here's the deal: When you post the proof of your alleged degrees AND it's verified, I will post the information about my psychology degrees.

I'll even sweeten the deal. *After* your information is verified, I'll post my data and then leave the scanner groups forever.

So what do you say, Toilet Boy? Are you man enough and honest enough to accept this challenge?

Until then Toilet Boy, you are a liar and a fraud.

Not true. You can possess it. It might be illegal and you might be fined or imprisoned for having it, but you can have it.

> Wrong on both counts. You cannot possess a digital scanner (which doesn't
> exist yet anyway) without a permit in Canada.

3461. Is it illegal to listen to cordless phones?

Yes, I know its illegal to listen in on cell phones. But what about cordless phones? My scanner picks those up. The guy at Radio Shack said its illegal.

Here is the John-Corky we all know......

K S 0 F <REMOVEpio@paNOSPAMrg.org> wrote in message
news:9anm5.2328$Ur3.13959@news1.sttls1.wa.home.com...

> Glenn - Exactly what do you think the League or an ISP could (or would)
do??

Remove access like Fido and Sprint did.

> I have done NOTHING wrong.

Actually your mother and father commited the crime.

> I have been a good practicing amateur,

Jamming, swearing and making threats on the 523 repeater, that is your
pratice. Proven and verified by 4 other hams. That is your good practice.

>upholding all traditions the league
> stands for

When did they stand for drunk in public? Selling ham licenses. Denial
John-Corky, you've been diagnosed by a professional and found sick. Follow
the psycologist advise and seek help.

> & there is nothing wrong with my actions here online.

If this was alt.freak.stalkers.and.perverts you would be correct. It isn't.
You should be ashamed as 6 other people pointed out yesterday.

> The managers of my
> domain
> "parg.org" have no problems with me, so no online feed up the system would
> either.

PARG is a sophmoric group of morons which not one has ever identified
himself to the public. It is not your posting domain, you guilt is proven
by this lie. Why do you always hide @home as being your ISP John-COrky.
Because you have lost so many ISPs before.

> You are grasping, & have NOTHING to grasp!

Typical perverted John-Corky. I bet you were drooling when you wrote that.

> You are angry because I exposed you when you were on rec.radio.swap in
1996

Back when you were helping an owner of a Coommercial radio shop scam hams. Yes, I exposed Joe and it caused you to jam repeaters and throw a John-Corky tantrum. Is 6 years ago the best you can fabricate? What a friggin moron.

> trying to pick up on teenage boys

Here John-Corky exposes his true self. Maybe you would troll for young boys on the net. Maybe you would be stupid enough to post your troll for young boys on rec.radio.swap. You have admitted to having sex with underage girls on this newsgroup so who can guess what you would do. If I were looking for a homosexual relationship as your try and accuse me of, I wouldn't be stupid enough to look on a radio swap group. What a friggin loon. Of course you are referring to the poor forge by Petey Boe PJB. You can do a dejanews search and find Petey whineing in alt.revenge asking for help. After I received a child porn picture caused by his forge, I turned it over to the Seattle FBI computer people. Not only did PJB pop up but guess who come up in the conversation with the FBI? John-call me Corky- Mackey. FBI. Uh huh.

> & you lost your ISP service from> Accessone.

Accessone gave me a month free access to ignore you. You called them and tried to tell them you worked for Netscape or something. You were so angry at me you called them for days on end. It was a joke on the internal accessone. newd newsgroup.

Nice try Corky, but you aren't hiding this next bit either. You must be scared or you wouldn't SNIP it and try to hide it. You would be posting all sorts of crap but it scares you. The ARRL could take your VE and OO away from you like Bert Fisher got stripped. Hide it John-Corky and "we" will just repost it.

> "Glenn" <glenn.hansen@usa.net> wrote
> > Better yet people should continue to complain about you to
> SNIP

What Corky-John SNIPped.....

Better yet people should continue to complain about you to abuse@home.net also a letter or forwarding of your nonsense to ARRL at hq@arrl.org , Northwestern Division Director Greg Milnes w7agq@arrl.org, William Sawders Oregon Section Manager k7zm@arrl.org, ARRL Volunteer Examiner Coordinator vec@arrl.org, Jahnke, Bart, W9JJ, Volunteer Examiner Coordinator w9jj@arrl.org, Manager (Exams, VEs) bjahnke@arrl.org, and maybe Maria Somma VEC Services Supervisor msomma@arrl.org and question their choice example of a Ham Radio Operator/VE/OO.

Do it folks. Just copy and then forward every garbage pile John-Corky posts to the ARRL and @home. Let these people see what John-Corky is doing for Ham Radio.

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists. |

Uniden sells refurbished scanners dn you can check current |
inventory at their web site: |
http://www.uniden.com/docs/store

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 7825 Black Street Rd., LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

You may be able to obtain manuals for older Midland scanners from:

Midland Consumer Radio Products
1670, North Topping,
Kansas City,
MO: 64120
Phone: 816-241-8500

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer the ICOM IC-R2, Uniden/Bearcat | BC3000XLT, and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and

larger book stores for under $13. Police Call Plus is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It

is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at

http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country since 1994, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 11" by 17" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc. See http://www.megsinet.com/~parnass for a sample.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $10.00, the deluxe report includes and extra index sorted by frequency and a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $39.95 for deluxe RadioMap report with histogram and additional index by frequency. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look up civilian aero frequencies for specific airports at: http://www.airnav.com/airports/.

Other frequency web sites include:
http://www.fordyce.org/scanning/ and
http://www.scannerway.8m.com.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or

anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the

channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Examine the Antenna to Determine Frequency Band

You can often determine a transmitter's frequency band by the size and type of antenna used.

The Police Call Plus book contains sketches of antennas. Antenna catalogs are crammed full with antenna pictures and specifications and they are usually free. Contact Antenna Specialists (216-349-8400), Cushcraft (603-627-7877), Tessco (800-472-7373), Maxrad, Larsen Electronics (800-426-1656), and other companies in the land mobile equipment business.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have

the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus

service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner, and
rec.radio.info. It is also available electronically from
the rec.radio.scanner ftp archive on the official USENET
FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their crystal controlled,
transistor Plectron and Motorola desktop monitor receivers.
They have now been replaced by battery operated portable
pagers, and the desktop models are often available at
hamfests in the $5 - $25 range. Since many are in rough
condition and need repair, a hamfest special is better
suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They are desktop models
which can be powered from 117VAC or 12VDC with the proper
mobile cord. The audio quality of a Plectron P1, Plectron
700 series, and Motorola Alert Monitor is far better than
any consumer grade scanner and the sensitivity, image
rejection, and intermod immunity is outstanding when
aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band
receivers: VHF-low, VHF-high, or UHF. No single Plectron
or Motorola Alert monitor can cover the entire 30-50 MHz

band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the 700 and R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal

scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

30-54 R8190 R8150
148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

The tape recorder inside the Receiver/Recorder employs two rubber belts. The Projector Recorder Belt Company makes replacement belts which work fine, though they may not be the original equipment:

1. PRB SCA8.6 (218 mm)
2. PRB SCQ 2.5 (64 mm)

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Crystals

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

The best source for crystals is:

International Crystal Mfg Co.
11 N. Lee Ave
Oklahoma City, OK 73102
tel. 405-236-3741, 800-725-1426
